>up somewhere by the end of the inner conductor. Your dipole's finished.

There's a neater way to do this, Peter. After you strip off the outer
insulation, push back on the braid. It will loosen like a chinese finger
trap. Now you can turn it inside out like a sock, *rolling* it back over
the cable until it forms a 1/4-wave sleeve below the exposed inner
conductor. This forms a sleeve dipole which offers decoupling of
the feedline from antenna currents while your approach does not.
Form a small loop in the end of the inner, attach a heavy bit of twine,
and you have an antenna you can hoist into the nearest tree. This sleeve
dipole works at least as well as a J-pole, and is simpler to construct. The
only material needed is a length of coax.

Note that you'll have to cut back more than a quarterwave of the outer
insulation to wind up with a quarterwave braid sleeve, so you'll have to
trim the exposed inner down to a quarterwave to finish it off. A bit
of experimentation with the cable you are using will show you where to
cut the outer insulation so that you wind up with a quarterwave sleeve.
You can overwrap the sleeve with electrical tape to make a finished
antenna that can tolerate handling and the weather. Or you can enclose
the whole thing in a length of heat shrink tubing, that's what I do.

With a bit of practice, you can crank one of these out in less than 5 minutes.

I sure agree that a calibration check is a good idea, but I'd not use a
car battery! Lead-acid batteries have a well-known voltage-versus-charge
curve, and the voltage depends heavily on the charge. A fully charged
"12V" car battery that's been left idle for a while (off the charger)
could easily hit 13 volts. (I use my voltmeter to tell me how much charge
is left in my trailer battery...)

That begs the question, what is a good stanadard? Maybe a fresh
alkaline or lithium cell checked against a known-good meter??
(Maybe a "9V" alkaline battery to get close to the desired 12 volts.)

Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.misc,rec.radio.amateur.digital.misc

I'm designing an interface to retrofit my old NOAA Weather alerting radio to receive the new digital EAS/SAME signal. This is a 521 bps AFSK signal that you may have heard recently if you monitor NOAA weather radio.

I need a modem chip, commercially available, that's programmable for that odd 521 bps rate. Once I get a data stream (parallel or even serial), from there it should be easy to feed it to a microcontroller so that the information from the EAS/SAME alert would be displayed on an LCD, and the CPU would turn on the radio when the transmitted alert location matched the user's.

Any avenues I should follow? I'm good with microcontrollers, not so good with modems (even less good with DSP's). Any ideas much appreciated!

Some time ago I found on the web, plans by KI7ZD for a colinear
(half over half) version of the j-pole(it's constuction was mostly
copper pluming parts). This may explain the confusion as it should
have some gain over a dipole.

This is good advice. Basically there are no 'magic' antennas - whatever any supplier claims - there are simply ways of making them work in different places and in different ways! I find it quite amazing that a) there is so much 'hype' about an antenna like the G5RV and b) that so many people are willing to dish out upwards of 30 - 40 quid to buy so called 'ready-made' (even high power) G5RVs, windoms and the like!

Incidentally, when I first became interested in radio one of my mentors was Louis Varney, G5RV himself. The G5RV antenna was designed simply to give good performance on 14MHz - its 3 half-waves in phase and therefore has good broadside gain if fed carefully (so as not to disturb the balance). 21 MHz didn't exist as an amatuer band, and the additional resonances just follow from simple maths!

G5RV always uses an antenna tuner with his G5RV (!) which comprises the usual 102' top section with about 50 ft of 450 ohm ladder feeder straight to the shack - ie no dodgy bits of coax or ferrite baluns in strategic places. When I last saw the ATU it was a super duper jobbie with plug-in coils for each band.

So follow Walt's (and Louis's) advice - erect as big a doublet as you can get away with, feed it with open wire feeder, and tune it with an ATU. Its worked for me for the last 25 years!

Source record: 91789

I am somewhat new to radio design, so I have question about crystals and overtones. I would like to build a LO with a freq in the 2m freq band. Since this is in the 146MHz range I would like to use an overtone oscillator. I have looked in catalogs (such as Digi-key) and I have found xtals that list the fundamental freq, but not the overtone. Also the selection is rather poor. My question is where do I find xtals with a selection that covers the freq bands in small steps, and lists the overtone freq of the xtals?

Thanks for any help.

Yes, I considered that. With the kind of test gear that I use hear
(Old EiIco scope, Heath sig generator, etc.) this is always a
possibility. But I got the same readings from both my VOM and from the
Heath VTVM that I recently calibrated. Meter inaccuracy may be part
of the problem, but I think the regulator was just on the low side of
the tolerance range.

Thanks to all the FB help that I got from hams on the net I was able to resolve the problem. I put two diodes in series between the regulator's ground terminal and ground. This raised the output voltage to just under 12 volts.

The regulator is still running a bit hot. I put some additional heat sink protection on it but I still want to cool things down a bit. I'm considering trying to take some turns off the transformer secondary to get the input voltage to the regulator closer to an optimal value.

Thanks!

# 1827. Re: Crystals and overtones

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-13 00:00:00 UTC
From: larsm@lin.foa.se
Message-ID: <33f17623.6633841@news.lin.foa.se>
Source record: 91795

I missed the first part of this thread due to summer vaccation but I find the discussion interesting. I have always considered overtone crystals to operate in serise mode, i.e. one can usually replace the crystal with a low ohmic resistor to check the oscillator (this is not always possible).

My question to the audience is: What is the best oscillator ?

Using a crystal controlled oscillator the prime factor is of course stability. Designing one off does mean I do not have to worry about a few extra component as long as the performance is good.

I have used the Butler overtone lately (as suggested by Randall Rhea/ Eagleware and R J Matthys) and the output is very near the series resonance of the crystal and thus I do not need to pull the crystal. Introducing inductors and/or capacitors to vary the frequency means the stability will degrade due to component change.

Using inductors and capacitors to control the exact frequency gives me trouble with microphonics and vaiation over time and temperature.

Should I order crystals off the wanted frequency and try to pull the to the desired frequency? Or specify a certain load capacitance?

I will try to use a mmic with diode limiting to see what performace it will give. Maybe this will be the best of two worlds, good performace and a low parts count (giving high stability).

Any comments or suggestions???

I have used this method on several high power (1 kW to 1.5 kW) 144 MHz amplifier plate circuits. It works very well, and while the silver layer is rather thin, it is not *that* thin. It looked very good and the efficiency / power output of the amplifiers increased sharply (the plate lines were bare copper and brass before plating). This method is electroplating of a sort, since you do use an electrical current to deposit the silver.

Grab the February 1985 issue of ham radio mag and check out the article. Do exactly as it says. From my own experience, there are two cardinal rules:

1) Make sure the surface to be plated is absolutely clean before you start plating (and definitely make sure you don't get fingerprints on it after cleaning)!!!

2) Rinse the parts thoroughly after plating! The solution is very caustic and will corrode your prized circuits if you don't get all of it washed off. Just run cold water over them for 5 to 10 minutes and all will be well.

On second thought, it's the hypo that will contain the silver washed out of the emulsion after the developing process is complete - not the developer, per se.
Sorry, if I mislead you on that. It's been several years since my darkroom was turned into a ham shack - Hi.

Sure, I've used tuners, but gave up on them when I found they didn't make a
bit of difference in a signal's SNR. Sure, they make a perceived difference in
signal strength, but I can do the same thing by turning up the volume on my
receiver--more signal ...and more noise.

I've been spreading my ignorance on this subject for a long time, huh? Hardly.
This is my first post on this topic, and my first post to
rec.radio.amateur.antenna for several years.

At 521 bps, it would make more sense to just build a simple RC
mark/space filter and interface it directly to an I/O port on the
microcontroller. You should be able to 'demodulate' it in software,
with no need for a modem chip.

That being said, you could also use the old Motorola MC14412 (?) 0-600
bps modem chip, if it's still being made. I used to run a homebrew
14412-based modem on my Apple II at 300 bps. (Frankly, that probably
could've been done in software as well, even on a 1 MHz 6502.)

Moritz,
I think you're wrong, but you have a right to your opinion. I, personally, would use a J-pole antenna any day of the week over a 1/4 wave verticle. I've built and used both. I still custom build and use aluminum J-pole antennas.

# 1836. Re: 11 volts from 12 volt regulator?/ Vrms vs. Vpeak

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-13 00:00:00 UTC
From: europa@primenet.com
Message-ID: <europa-ya023580001308972301500001@news.primenet.com>
Source record: 91804

:
:To start, 1.414 times 18 volts RMS equals about 24 volts DC. The
:difference between 12 and 24, or 12 volts, is dropped across the
:regulator. Power dissipated would be output current times 12, or 12 watts
:for 1 Amp load current. This may exceed the regulator's ratings, and
:would explain an unusually high temperature. However, if there is any
:noticeable rise in temperature when there is NO load current, then you
:have a defective regulator.

24V DC is no-load current. In that case little or no current is being drawn from the load, so no heat dissipation. Depending on the internal resistance of the transformer secondary, and the filter cap value, the cap voltage should start to approach (Vrms- 2 diode drops) under heavy load. I've seen formulas in books for giving an exact calculation. So dissipation is going to be approaching 6W at the regulator current of 1A.

:
:Getting 11.1 volts output is poor, but may just be the result of being on
:the low side of tolerance. If everything else checks out OK, you might
:try connecting a rectifier diode between the common terminal of the
:regulator, and ground. Result would be 11.1 plus 0.7, or 11.8 Volts
:output. Two in series would raise it to 12.5 Volts. If this doesn't
:appear to work, then try connecting an additional 1K resistor between the
:output terminal and the regulator's common terminal, to ensure that the
:diodes are forward biased.
:
:73, Fred, K4DII

For maximum ripple suppression, any time a network is inserted between the ground lead and real ground, a filter cap of 10-100uF should be put in parallel with the network. This goes for the LM317 as well as the 78xx series.

However, then there is a possibility of device damage if the input to the regulator is shorted, since cap energy is routed thru the regulator. Then you need to put a couple of extra diodes in to shunt the cap energy around the regulator. See Nat Semi Linear databook.

OK, explain to me how the tuner can bring the desired signal up 3-4 S units,
but not bring the noise level up at the same time.

>>Modern receivers have plenty of gain. As long as the antenna brings in enough
>>signal so that it's above the receiver's noise floor, antenna tuners and

>>in the MFJ. Probably far inferior to the front end of your Kenwood.
>
>Wrong again. Using the preamp, I can hear signals that were not
>readable without the preamp.

Then your receiver doesn't have adequate gain or you have a lousy antenna. As
I said, most modern receivers are not lacking in gain. All you really need in
an antenna is one that will bring the desired signals up above the noise floor
of your receiver. Note that this does not address gain antennas, which
increase signal strength but sacrifice directional coverage.

>I did extensive "A-B" tests when I received this unit. There is a
>large performance gain with the unit.

Performance gain measured how? By increased signal strength? This is just a
red herring, and the reason why so many antenna tuners are sold. The real
measure of a device, such as an antenna tuner, is if/how it increases the
signal-to-noise ratio.

There's always the possibility that your tuner is acting as a rudimentary
preselector and filtering out signals that are causing cross-modulation,
intermod, etc., which is what may be the cause of the performance gains you're
hearing.

>You seem to be one of those people who say "Oh, that won't work!" in
>the face of evidence that it does work. Therefore, I conclude you
>don't know what you're talking about.

And you probably believe that "make money fast" pyramid schemes work...

I don't think you're going to find a modem chip to handle that (though I'm not absolutely sure) and a DSP is way overkill (though pretty cool), but AFSK is fairly easy to decode (just think RTTY).

Check out the ARRL handbook and back issues of QST and 73, and you'll find plenty of RTTY AFSK demodulators from the simple to the complex that you could adapt for your project, though you will probably have to tweak the tone frequencies a bit.

I lost the beginning of this thread.
Try searching for plated through holes or PTH on the web. I had a
bookmark giving detailed instructions at one time, but can't find it
now.

>
>greetings // Lars (SM4RZW)
>

Yes, this is correct. The fixing bath (sodium thiosulfate) removes the
remaining silver salts from the paper/film after it has been developed,
leaving the argentic silver on the paper/film. After a bit of use the
fixing solution becomes quite laden with silver salts.

It is usually only necessary to dip a piece of clean copper (cleaned of
oxide) in the solution to silver-plate it. Other materials, such as
brass or bronze, may have to be electroplated.

I have been doing this for years.

Jerry's right. It would be a poor HF receiver indeed which would benefit from
a preamp. Any reasonable HF receiver is limited by atmospheric noise, not
internal noise, and a preamp will amplify that equally with the signal, thus the
SNR will not be improved. The preselection may sometimes be of benefit,
but any competent receiver already has plenty of gain. (Now on VHF+, an
*antenna* mounted preamp can be very useful, but for HF, forget it, atmospheric
noise dominates.)

FLEA all SUMMER at MIT
August 17th, 1997
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >1000 cars!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Seperate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

> you have to first develop a hell of a lot of prints or film. OK?
>
> 73 de w9dmkYes, that's correct. In a used fix bath there is silver di(tiosulphate).
The process is:
After development, when all the exposed silverbromide crystals have been reduced to metallic silver (wich is black since it's very fine powder), the prints has to be fixated, the unexposed crystals of silverbromide has to be removed. That is done by a solution of potassium tiosulphate: AgBr + 2 S203 (2-) ==> Ag(S2O3)2(3-) + Br(-).
Both of the resulting substances is water soluble, so they end up in the fix bath.
If the prints shouldn't be fixated, the unexposed crystals will go black as well when exposed
to daylight.

I've read that 1 square meter of print paper contains 5-15 gramms of silver.
The discussion above is of course only valid for black-and-white prints.

I am building a transmitter, and the schematics/plans that I acquired say to make an inductor by wrapping enamel wire around a ferrite slug. I have the wire, but I have been unable to find anything made of ferrite, let alone something that might make a decent core. Any ideas?

Well, I can see there is no way to make you see that the tuner works
and works well. It does what it's advertised to do, and I'm satisfied
with it. I'm not an expert or antenna guru, so I don't have a fancy
explanation. (Perhaps Gary Coffman will comment? I value his opinion,
and I'm sure he could explain this matter so even you could get it.)

## 1855. It's fixed, but... (HW-101)

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-14 00:00:00 UTC
From: ka8ddz <hynde@flash.net>
Message-ID: <33F3E02C.51B9@flash.net>
Source record: 91727
Body handling: HTML body converted to readable text

This is a multi-part message in MIME format.

I picked up an HW 101 at Dayton last year and finally got around to re-tubing it and putting it back on the air. I noticed however that the LSB reception was way out of whack, not having a manual I figured no prob, I'll just tweak the cap/coil/? for the lower side and put it back.

No chance, there are two rocks in the BFO for upper and lower, NO trim cap and no other way to adjust freq. I put a trimmer between the xtal and ground and brought it back into the passband of the IF.

A. Is it typical for old xtals to drift or shift freq?

B. Was this the best way to solve the problem short of replacing the xtal?

Try Amidon Assc. or RF Parts. Both advertise in QST and/or CQ and 73 Magazine. You might try a web search - I'm pretty sure RF Parts has a web page. I'm curious about how old the schematic for the transmitter is? Most modern gear calls for torroidal inductors as opposed to slugs. Good luck,

==========
To offload the 7812 device I would suggest you put a 2N3055 or
similar pass transistor in parallel, ensuring (with one resistor )
that at say 2 Amps load the 7812's contribution is 0.5 A. In ARRL
Handbook 1995 , circuits can be found on page 11.17

# 1858. DC-DC Converter

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-14 00:00:00 UTC
From: Norm Melick <henmel@worldnet.att.net>
Message-ID: <33F390FE.5405@worldnet.att.net>
Source record: 91730

I built a variable power supply that uses a digital meter. I'd like to replace the 9V battery used to power the meter with 9 volts off my power supply.

Can anybody direct me to a schematic or article to make a DC-DC converter?

Thanks alot for the BW.

From: "Carl R. Stevenson" <wa6vse@fast.net>
Message-ID: <01bca845$266b3060$5c95f5ce@wa6vse.fast.net>
Source record: 91807

If you can't find ceramic ones, you might consider fabricating something from Delrin (tm, I think), Nylon, or polycarbonate rod ... all can be machined
with simple tools and are good insulators ... if your application were at very
high UHF or microwave frequencies, you'd have to be concerned about the absorptive properties of the plastic, but at HF, AFAIRemember, all of the materials I mentioned should be OK ... also consider heat issues, as some plastics may soften if the environment is too hot ...

Good luck,

Carl - wa6vse

Hi...I have had a SAME decoder working here since last Jan....just built a simple PLL decoder then did everything in software. I used a 8051 and built a state machine that synch's up to the data stream till it has byte lock then does the SAME msg receipt. Works real well.....here the output is fed into the home automation sysem for alerting the house on severe wx in the local area.

Peter, he cross-posted to four newsgroups.

The message content was appropriate for all four groups.

He is not guilty of SPAM in its original definition of excessive
cross-posting, or ECP. Since his endeavor is primarily
non-commercial in nature and his cross-posts are on-topic, he is
not guilty of SPAM in its current definition.

I'll bet that you get a lot of unsolicited commercial email (UCE),
which we refer to as SPAM nowadays. You really ought to
SPAMproof your (R)eply-to and your (F)rom, and not put
your valid email address in the body of an article.
It'll help reduce your UCE SPAM-load.

Jim in Texas

I wish I would have thought of that when I had my SB-101, about 23 years ago. At that time, I thought the crystal filter was going bad. But I bet it was just crystal drift.

BANDWIDTH WASTER, ME, BUT WITH CAUSE:
I ASK EVERYONE WITH ANY INTEREST TO TRANSFER
THIS DOCUMENT TO A WORD PROCESSOR.

Then underline each place where a word may reasnobly be replaced with
some version of one of the following:

CUT TO FIT (including theoretical redesign)

TRY OUT (including any form of computer or breadboard or anything else
meant to allow easy reformation of a circuit.

QUICK AND DIRTY (meaning the pressure the engineers of the Ceasar's
Roman legions were under to get it done with a minimum time and cost, and
that practice has come down to the modern day unchanged.

TOLERANCE (including the words usually, generally, mistake, etc)

I think the blasters and ranters will be shown to be using
CUT TO FIT, TRY OUT, AND REPAIR.

we had cheap, fast low-test-rate design back in the days before
dirt was invented, also. I refer to the '50s not the 70's I was an
old hand at the game by then.

see end also.
Thank you.

>wa6vse@fast.net

NEGATIVE.

The single largest problem facing modern ANYONE is the same as ever: The preponderance of naysayers who have no idea what's going on outside their own little foxhole and think that means the world is behind them.

In the backward '70s, I devised a radio set made of '50s technology wedded to WW2 technology, and it transmitted music (admittedly poor quality, but it WAS only a prototype) over a bandwidth of 100 HERTZ.

this summer I mentioned it on these ham newsgroups. I got 97 replies, and ALL BUT 3 of them were naysayers, pointing out the known limits why it can't be done the way I said I had done it. All too polite to call me a liar, of cuss, of cuss, but nonetheless saying it can't be done.

But I did do it, back there in the '70s

Haven't been able to sell it, ain't gonna give it away for some snot nose engineer to sneer at until he/she sees how it works and then try to claim credit for. I been down that road and up that tree, and all I got was ticks.

2 of the remaining 3 replies offered encouragement, an ONLY one gave serious advice, which was all I had asked for in the first place.

BTW, about code, do you have a garden? no wheelbarrow, I suppose? Or shovel? Use electronic gardening only, do you? Old dont mean get rid of.

I looked in the 1997 Handbook in the Index and then in Receiver Projects section and could find no mention of the "High Performance Receiver" There are however discussions about some high performance building blocks, like the Makhinson Front End, and the Horrabin H-Mode mixer.

(Note to anyone reading this message that works on the ARRL Handbook:

The ARRL Handbook has one of the worst indexes of any technical book I've seen. You'd think that now that we're in the computer age, it would be easy to produce one, since many word processors do it automatically. Time and time again I have to leaf thru hundreds of pages to find something that I know is in the book, but can't find it in the index.)

# 1868. CALIF MOBILE ANT FS TRIALS

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-15 00:00:00 UTC
From: w6kkt@frazmtn.com
Message-ID: <33f45ed8.121087@news.frazmtn.com>
Source record: 91736

75m Mobile Antenna Field strength trials will be held August 17th (Sunday) starting 8:00AM. Frequency 3995. Antenna height(tip to ground) 13.5' max.

Location: Bluff overlooking Pacific ocean , south of Carpenteria, Ca in Santa Barbara County (11.9 miles south of Santa Barbara and 13 miles north of Ventura, Ca.
101 freeway to "Hwy 150, Ojai, Lake Casistas exit. From top of exit ramp turn west to frontage road. Turn left (south) on frontage rd marked "NOT A THROUGH ROAD", continue up the grade of frontage road and onto the dirt path at the end of pavement to the top of the mesa. Drive with care on the dirt surface. The area is quite passable but is un maintained and has ruts, dips etc.

Lodging: Motel 6, Carpenteria, Ca., Santa Barbara, Ventura Etc; 1-800-4MOTEL6

For questions call Wally (WA6JPR) 805-969-9796 or Email: w6kkt@frazmtn.com

Talk in frequency: 3995 & 146.520 simplex

Not only are these mobile "shootouts" fun, but one can learn a great deal about their mobile antenna system performance from them.

73, Jesse, W6KKT

## 1869. Home brew exciter

## 1871. doppler velocity measurement

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-15 00:00:00 UTC
From: Heffner <mheffner@altair.ucdavis.edu>
Message-ID: <33F4F80F.6F4B@altair.ucdavis.edu>
Source record: 91739

I am looking for any information on how to build a reciever that will allow me to measure the doppler shift of a moving cw transmitter. The purpose is to measure the velocity of the transmitter wrt the receiver. I would like to operate in the 2m band. Please e-mail me any references.

Thanks,
Mike KF6FPW

My first attempt was garbled, but the second try should be more
readable. I recently bought an HP scanner.

You can also make a quicky 2M ground plane using five pieces of 19" segment cut from coathangers and an SO-239 connector. Solder one 19" wire straight out from the center conductor, solder the ramaining 19" segment at each corner mounting screw-hole, 90 degrees from the center conductor. If you aren't satisfied with the SWR, trim the length of the center conductor wire, and/or bend the wires at each corner to more than 90degree fron the center conductor wire.

Quick, easy, cheap! Had one up all through a winter one year. Worked great!

>didn't know how to build one of those.

What you could've done was to build one and adjust the output for 12.00 +/-
0.005 and show the customer the output on a 3-1/2 digit DVM and say "There
you are! 12 Volts exactly!"

Alan

## 1876. Ham Database/Newsgroups

Newsgroup: rec.radio.amateur.homebrew

>not uncommon, someone out there should know how to do it.

Thanks for the info. I've heard of this but feel that at the current
level that I'm after I really have to track down a proper 48V
alternator.
Lestek in the US are sending me their current catologue but I may have
to strap two units together.
Now I'd like to find someone who knows something about PTO's off the
prop on military vehicles, I don't fancy snapping the crank when I key
the mic.

Ooops!

For the uninitiated; LOSA is not a Usenet spam; it is a list of applications of the "Stamp" microcontroller card. On the contrary, quite useful and inspirational piece of work IMHO.

This message seems to be posted to all the related newsgroups, which is the appropriate thing to do (crossposting is better than posting seperately to each group.)

What you may be looking for is a portable heavy duty welder. This could crank out the voltage and current you need. Maybe float a bank of lead-acid batteies across it. There could be some problems with regulation here, but nothing that couldn't be worked out.

# 1886. How do you connect LED's in parallel?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-16 00:00:00 UTC
From: kr4wm@sccoast!.net
Message-ID: <MPG.e6035f4eb4e8e229896af@news.infoave.net>
Source record: 91665

I'm working on a project for a friend, and need to connect two LED's in parallel. When I hook them up, only one lights, the other just sits there. I'm supposing that the one which draws the most current is the only one which will get any current through it, or something like that. Don't need to understand the theory, just tell me what I need to know to get it working- please. We'll discuss why this happens in another message thread- it's Saturday night, and I have to get it back to the owner on Monday morning (hopefully in working condition). No, it's not something I broke. It's a clock with an ambulance on the face, and the ambulance has three LED's for emergency lights. You push a momentary contact switch, and the LED's alternate, i.e. Two parallel LED's light at one time, then go out, and the third light comes on, and they do this back and forth contunially. At one time, it worked like this from the factory (who's out of business). I had to home brew a siren and this light system without the benefit of having the old circuit to look at. This is something I'm rigging up for the owner, who likes flashy stuff. Thanks in advance for any advice- 73, Web- KR4WM in Myrtle Beach, SC

>From: "William E. Sabin" <sabinw@crpl.cedar-rapids.

Hi Bill.

Well now, a number of years ago, I stopped purchasing a new handbook every year after having done so for many years and paying for a new book only to get 5 percent of a new book. The rest of it was in my old handbook. I guess that was the first time I realized that there wasn't any tooth fairy, no real santa claus and ham radio started to look just a tad jaded.

Now I've got a 1991 handbook (purchased) in the shack, and a 1988 handbook (purchased) in the shop, and maybe, if I like the cover of the one next year, (You never get to look inside before you buy them you know!) I'll buy a new 1998 and move the 1991 to the workshop. It's about as frequent as I get anymore.

I'm sure I'll enjoy your contribution to it, and maybe a few of the others who labor so hard to provide a little payback for their hobby of so many years, but at the current price, it had REALLY better be good.

Meanwhile, back at the ranchhouse, in MY copy of the handbook, the index leaves something to be desired.

I don't bother with MIME'd messages, so not real sure about your comments, but reading between the lines, figure it was something about the Cu wire tables

> serious advice, which was all I had asked for in the first place.

I believe if your check back, you'll find that I gave you nothing but some
simple
advice on how to protect your ideas, based on my experience in getting a
couple
of patents ...

I don't recall bad-mouthing you, or your claims of accomplishment, but I do
recall
having serious doubts that you knew what the hell you were talking about
..
(but again, if I recall correctly, I kept them to myself ...)

> But I did do it, back there in the '70s
>
> Haven't been able to sell it, ain't gonna give it away for some snot nose
> engineer to sneer at until he/she sees how it works and then try to claim

> credit for. I been down that road and up that tree, and all I got was
ticks.

If it was worth much, you should have been able to patent it and license it
by now ...
>
> BTW, about code, do you have a garden?

Nope ...

> no wheelbarrow, I suppose?

Nope ...

> Or shovel?

Nope ...

> Use electronic gardening only, do you?

Yup ... all I grow are electronics things ...

>Old dont mean get rid of.

In technology, old=junk=toss it (or sell it if you can find someone to give
you 10 cents a pound to haul it off ) ...

486 machines are getting hard to give away ... 386's are ancient,
out-dated,
and won't run much modern software ... 286s??? The electronic equivalent
of dinosaurs ... XTs??? Primordial slime ...

Yes, in some venues, old DOES mean "get rid of" ...

Looks like it to me, with that sort of input voltage, you should get
12V out no trouble, very like the regulator is out of spec.

This is not spamming! It is useful information for a lot of people
involved in computer control and also home automation.

Whats the input voltage to the regulator . Sounds like it could be on the
high side causing the regulator to dissipate a lot more power than it was
designed. A lot of times a 18volt xfmr will actually put out 20 volts or
more. Also just how much power are you running out of your TX 4or 5 watts
can easily use up your 1 amp. Radio shack parts speak for themselves. When
I use a 3 legged regulator I prefer the ones in a TO-3 case. Seems to
have less problems with them. Also use some bypass caps on the input and
output of the reg. If you are working the reg near its limit s I'd suggest
going to a 3 amp device

# 1897. MRF 479 Needed

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-16 00:00:00 UTC
From: "James R. Binkley" <w4aos@his.com>
Message-ID: <33F600D2.3F19@his.com>
Source record: 91759

Does anyone know where I can get an MRF 479 transistor, or its equivalent. I need one for a portable transciever I have, and don't find this transistor listed in any of my catalogs.

Thanks Bob w4aos@his.com

# 1898. Re: PL259 Attachment to COAX Cable

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-16 00:00:00 UTC
From: markem@primenet.com
Message-ID: <5t515c$s7@nntp02.primenet.com>
Source record: 91760

Most of the mail order connector/cable outfits have teflon/silver PL-259's for $1.00-1.50 each depending on qty, even cheaper if you buy lots of 10. The silver plated adapters go for 25 - 30 cents each. The silver-plated 259's are MUCH easier to solder and if you're using the adapter for RG-58, they'll suck the solder right in and give a great connection to the cable. Of course, my old Weller 350W gun helps a little too...

I started to answer this para by para, and then came to the peroration.
486 he says is hard to give away, etc, and 386 is worse, and so on
Let Then Eat Cake, said the queen.

With that he shows how he is divorced from rfeality.

The flea markets are loaded with 8088 machines that sell well for about
150 bucks and get people started on computing who haven't BEEN to
college to learn the show.

This is the same kinda guy who says if you aint't got the latest and greatest
you are kidding yourself, while all around him, others do it better and cheaper.

In one place, he says it must have been poor quality radio, and in another, he
says he didn't badmouth me, and in another he says he didn't think I knew
what I was talking about.

Hoo, boy.

Ciao.

Lou Hinshaw
Next thing for me to do is be kind to sorts like this, but mostly myself, and quit wasting time on this NG.

There is nothing avalable at this time. I have some info from NOAA, and the odd rates where chosen so nobody could hack the thing easly. I am planing on building a unit also, and have been looking at some of the older RTTY stuff to get the job done. This is not the best way to do it, the parts count will be a bit high, but size is not a consern of mine at this time.

Don't talk to me about 2m xtals! :-) I've been trying to get a UKW Berichte transverter design to work for the past fortnight and the LO (116MHz crystal series resonant with a grounded gate JFET) doesn't want to osciallate, I've tried everything (including hooking the xtal up to an HP8753D Vector Network Analyser (300kHz - 6GHz!) to make sure that the xtal is working). I've just got my license about a fortnight ago but I still haven't been on air...

Re your questions however: fundemental mode xtals can be operated in their overtone mode BUT they won't operate on the exact odd multiple (thus their overtone freq. won't be specified). You are probably better off using a standard xtal and multiplying it by say 18 or so, this allows a reasonable tuning range of 100kHz at the desired frequency. I'm in the UK so sending you the address of UK suppliers won't be much use I'm afraid.

73 and good luck de Laurens M1CCO

Ham-Homebrew Digest
Sat, 16 Aug 97 Volume 97 : Issue
459

Today's Topics:

11 volts from 12 volt regulator? (2 msgs)

12V portable electronic Cooler/warmers

Crystals and overtones (2 msgs)

Double Sided PC Boards

F.S. - Tubes, radios, books, misc...

Front end of DC RX

Ham Database/Newsgroups

Ham shops in Tennessee

High performance...Not the handbook. (2 msgs)

How do you connect LED's in parallel?

MRF 479 Needed

Need CRYSTAL SET plans

PL259 Attachment to COAX Cable (3 msgs)

Wanted - Copy of Article: Ham Radio Feb 85

WTB: 25K pot

Whats the input voltage to the regulator . Sounds like it could be
on the

high side causing the regulator to dissipate a lot more power than
it was

designed. A lot of times a 18volt xfmr will actually put out 20 volts
or

more. Also just how much power are you running out of your TX
4or 5 watts

can easily use up your 1 amp. Radio shack parts speak for themselves.
When

I use a 3 legged regulator I prefer the ones in a TO-3 case.
Seems to

have less problems with them. Also use some bypass caps on the input
and

output of the reg. If you are working the reg near its limit s I'd
suggest

going to a 3 amp device

Looks like it to me, with
that sort of input voltage, you should get

12V out no trouble, very like the regulator is out of spec.

Regards

I asked

>him the tolerance, he said "none. Exactly 12 volts." I had to admit
that I

>didn't know how to build one of those.

What you could've done was to build one and adjust the output for 12.00
+/-

0.005 and show the customer the output on a 3-1/2 digit DVM and say
"There

you are! 12 Volts exactly!"

Just go to DigiKey ( http://www.digikey.com
) and by a 50.000MHz sine

wave oscillator for 2 or 3 bucks. I doubt whether you could tweak

the third harmonic down 3MHz from 53 to 50 anyway.

>

> How does a homebrewer plate thru holes in making oc boards?

> I have a X-Y table used to draw the art work on both sides of

> the pc board and drill them. Then how do you go about plating

> thru the holes?

I don't know how I would do it at home. In a board shop, they do what
is

called electroless plating, basically dipping the board in a solution
or

suspension of fine copper particles before it is etched but after it
is

drilled. The copper particles adhere lightly to the surfaces of the

board, including the shafts of the holes. Takes some specific chemistry

in the solution to make that work, but it does work. The boards are
then

plated with copper, more copper, that is, and the holes end up with half

an ounce or so of copper plated into them. The next step is to clean off

the resist that had been screened or photoplotted on the board. Under

the resist, the copper is thinner. Etching will remove all the

previously resist-covered copper but only half the bare copper areas

that had been thickened by the plating. The board is done.

good luck.

I started to answer this para by para, and then came to the peroration.

486 he says is hard to give away, etc, and 386 is worse, and so on

Let Then Eat Cake, said the queen.

With that he shows how he is divorced from rfeality.

The flea markets are loaded with 8088 machines that sell well for about

150 bucks and get people started on computing who haven't BEEN to

college to learn the show.

This is the same kinda guy who says if you aint't got the latest and
greatest

you are kidding yourself, while all around him, others do it better
and cheaper.

In one place, he says it must have been poor quality radio, and in another,
he

says he didn't badmouth me, and in another he says he didn't
think I knew

what I was talking about.

Hoo, boy.

Ciao.

Lou Hinshaw

Next thing for me to do is be kind to sorts like this, but mostly myself,
and

quit wasting time on this NG.

Subject: High performance...Not the handbook.

>From: "William E. Sabin" <sabinw@crpl.cedar-rapids.

Hi Bill.

Well now, a number of years ago, I stopped purchasing a new handbook every

year after having done so for many years and paying for a new book only to

get 5 percent of a new book. The rest of it was in my old handbook. I

guess that was the first time I realized that there wasn't any tooth

fairy, no real santa claus and ham radio started to look just a tad jaded.

Now I've got a 1991 handbook (purchased) in the shack, and a 1988 handbook

(purchased) in the shop, and maybe, if I like the cover of the one next

year, (You never get to look inside before you buy them you know!) I'll

buy a new 1998 and move the 1991 to the workshop. It's about as frequent

as I get anymore.

I'm sure I'll enjoy your contribution to it, and maybe a few of the others

who labor so hard to provide a little payback for their hobby of so many

years, but at the current price, it had REALLY better be good.

Meanwhile, back at the ranchhouse, in MY copy of the handbook, the index

leaves something to be desired.

I don't bother with MIME'd messages, so not real sure about your comments,

but reading between the lines, figure it was something about the Cu wire

tables

From: kr4wm@sccoast!.net (Web Williams)

Subject: How do you connect LED's in parallel?

I'm working on a project for a friend, and need to connect two LED's in

parallel. When I hook them up, only one lights, the other just sits

there. I'm supposing that the one which draws the most current is the

only one which will get any current through it, or something like that.

Don't need to understand the theory, just tell me what I need to know to

get it working- please. We'll discuss why this happens in another message

thread- it's Saturday night, and I have to get it back to the owner on

Monday morning (hopefully in working condition). No, it's not something I

broke. It's a clock with an ambulance on the face, and the ambulance has

three LED's for emergency lights. You push a momentary contact switch,

and the LED's alternate, i.e. Two parallel LED's light at one time, then

go out, and the third light comes on, and they do this back and forth

contunially. At one time, it worked like this from the factory (who's out

of business). I had to home brew a siren and this light system

without the benefit of having the old circuit to look at. This is

something I'm rigging up for the owner, who likes flashy stuff. Thanks in

advance for any advice- 73, Web- KR4WM in Myrtle Beach, SC

They also sell a silver plated version that is more expensive ($3.99),

part number 278-188. Also a UG-176 reducer for RG58/59 (2 for 99 cents),

part number 278-204. I have used these parts OK.

From: markem@primenet.com (M. Monninger)

Subject: PL259 Attachment to COAX Cable

Most of the mail order connector/cable outfits have teflon/silver PL-259's
for

$1.00-1.50 each depending on qty, even cheaper if you buy lots of 10.
The

silver plated adapters go for 25 - 30 cents each. The silver-plated 259's are

MUCH easier to solder and if you're using the adapter for RG-58, they'll suck

the solder right in and give a great connection to the cable. Of course, my

old Weller 350W gun helps a little too...

# 1904. A Regen RX that beats your Kilobuck RX!

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-17 00:00:00 UTC
From: "P. Singh" <singhpk@exit109.com>
Message-ID: <33F6CE5D.13EC@exit109.com>
Source record: 91673

Recently I made a Regen RX and was truly amazed by its
performance. This baby can receive anything from QRP
HAM CW or SSB stations on 80M or 40M to Megawatt Broadcast
stations WHEN SET UP and OPERATED PROPERLY.
It has very smooth , stable, noise free regen control.

IT also has audio AGC etc.

This RX was built due to the frustating performance of the
ten-tec 9 band SW kit. That kit has a very bad and noisy
regen control which is very edgy and NOISY. Also the varactor
tuning and RF AMP make it still more noisy.

This receiver is CUT above that one and is a lot simpler.

Its circuit follows :

```
|---|
------- REGEN---R7----------- R6 ------POS 6 V DC
ANT |L2 | |GND | _|_ |
------------------| D1 _ _C5 R5
IN | R3 _|_ _|_ |--------|---------||--- To LM386
| |_|D GND GND R4 | | Audio AMP
---------R2--->|__S_Q1__| |___|___|/Q2 |
| | | | | | | |\ |
| | | | C3 | _|_
_|_ L1 | R1 C2 | -|- C4
_ _C1 | --- | | | |
| | --- C6 | | | |
|----------|----------------------------------NEG 0 VDC(GND)
|
GND
```

Component List

C1= 90 PF variable Cap with gear reduction (available from DANS)
( try anything from 50 PF to 365 pF)

L1= 8 uH (40 Turns on RED Iron Toroid T-50-2)
L2= 3-4 turn link on the ( try different number of turns,
less=better)

R2= 47 OHMS
R1= 10K OHMS
R3= 100 OHM
REGEN = 5K OHM pot, the center terminal goes to L2,
one end goes to ground, the other end to R6-C5

C2= 0.01UF
C3= 10UF electrolytic
R4= 560K OHM
R5= 6.8K OHM
R6= 3.3K OHM
R7= 3.3K OHM

C5= 100UF Electrolytic
D1= RED LED
C4= 0.01 UF

C6= 100UF electrolytic

Q1= J305(J310, MPF102)
Q2= 2N2222A(2N3904)

Debugging hints:-
Reverse connections to L2 if you cant make it oscilate
by using the REGEN control.

A faint plop can be heard when the receiver goes into
oscilation. It works best at the threshold of oscilations.

The threshold of oscilation should be smooth (not be very edgy)
and should be free of all the Potentimeter NOISE, as it is
bypassed by a large electrolytic (100UF).

If selectivity is POOR, reduce coupling to the point of connecting
ANT to GROUND or totally disconnecting it.
The loss of signal can be more than compenstated by (careful)
adjustment of REGEN control.

For weak signal reception, the ANT was connected to DRAIN of
Q1 J305 FET. This was more than sensitive enough to work very well
a few feet (10FT) of wire thrown out of the aprtment window into
a small tree.

The Coverage can be changed by changing L1/C1.
The turns ratio of L2/L1 should be less than 1:10 for best
performance.
With a L1= 40T on T50-2 and C1= 90PF, the receiver covers
5 MHZ to 12 MHZ with smooth REGEN and very good performance.
Shunting C1 with a CAP of 120 PF NPO allows you to cover
3.5 MHZ to 5 MHZ with much more smoother tuning and stabilty.

The performance of this receiver has me truly amazed. It has
almost forced me to think about what (great) results can be
obtained with very little .

The audio amp using LM386 and having audio AGC can be posted
on request. This uses LM386, transistor 2n3904, 2 diodes IN4148
and a few R/C.

YOU ARE REQUESTED/ENCOURAGED to QUESTION everything and find the
result by experimentation.

Happy homebrewing and experimentation.

Thanks for your comments, Gary. As I said, I respect your opinion.
Maybe the Kenwood R-1000 is not that good? It's the first modern SW
radio I've owned. The tuner and preamp do seem to work. I have heard
weak signals with the preamp on that I couldn't hear without it. Also
the tuner seems to help the signal strength on bands that the antenna
isn't resonant on.

# 1906. WX-SAT receiver from FM radio - Would this work?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-17 00:00:00 UTC
From: KD1YV <jimkd1yv@ix.netcom.com>
Message-ID: <33F7039A.34C8@ix.netcom.com>
Source record: 91675

I am interested in trying out some of the weather sats, but not interested enough to invest a ton of money. I have read recently that the sats of interest operate around 137 MHz wideband FM. None of my ham receivers have a wideband option, so I wondered if the following might work.

I would intend to create a simple 30 MHz oscillator fed into a mixer circuit of some sort, with the other input to the mixer being the received signal from the antenna. The output would then be fed to a conventional consumer-type FM receiver, tuned around 107 MHz.

Could anybody comment whether something this simple could work? Has anyone tried something similar? Is my design philosophy out in left field?

Ham-Homebrew Digest
Sun, 17 Aug 97 Volume 97 : Issue
461

Today's Topics:

Ham-Homebrew Digest V97 #459

Needed: Modem chip to decode EAS/SAME signals

Send Replies or notes for publication to: <Ham-Homebrew@UCSD.Edu>

Send subscription requests to: <Ham-Homebrew-REQUEST@UCSD.Edu>

Problems you can't solve otherwise to brian@ucsd.edu.

Archives of past issues of the Ham-Homebrew Digest are available

(by FTP only) from ftp.UCSD.Edu in directory "mailarchives/ham-homebrew".

We trust that readers are intelligent enough to realize that all text

herein consists of personal comments and does not represent the official

policies or positions of any party. Your mileage may vary.
So there.

Date: 17 Aug 97 14:05:22 GMT

Whats the input voltage to the regulator . Sounds like it could
be

on the

high side causing the regulator to dissipate a lot more power
than

it was

designed. A lot of times a 18volt xfmr will actually put out
20 volts

or

more. Also just how much power are you running out of your TX

4or 5 watts

can easily use up your 1 amp. Radio shack parts speak for themselves.

When

I use a 3 legged regulator I prefer the ones in a
TO-3 case.

Seems to

have less problems with them. Also use some bypass caps on the
input

and

output of the reg. If you are working the reg near its limit
s I'd

suggest

going to a 3 amp device

Looks like it to me, with

that sort of input voltage, you should get

12V out no trouble, very like the regulator is out of spec.

Just go to DigiKey ( http://www.digikey.com

) and by a 50.000MHz sine

wave oscillator for 2 or 3 bucks. I doubt whether
you could tweak

the third harmonic down 3MHz from 53 to 50 anyway.

wrightj@planetc.com wrote:

>

> How does a homebrewer plate thru holes in making oc boards?

> I have a X-Y table used to draw the art work on both sides
of

> the pc board and drill them. Then how do you go about plating

> thru the holes?

I don't know how I would do it at home. In a board shop, they
do what

is

called electroless plating, basically dipping the board in a
solution

or

suspension of fine copper particles before it is etched but
after it

is

drilled. The copper particles adhere lightly to the surfaces
of the

board, including the shafts of the holes. Takes some specific
chemistry

in the solution to make that work, but it does work. The boards
are

then

plated with copper, more copper, that is, and the holes end up with

half

an ounce or so of copper plated into them. The next step is to clean

off

the resist that had been screened or photoplotted on the board. Under

the resist, the copper is thinner. Etching will remove all the

previously resist-covered copper but only half the bare copper areas

that had been thickened by the plating. The board is done.

good luck.

I started to answer this para by para, and then came to the peroration.

486 he says is hard to give away, etc, and 386 is worse, and
so on

Let Then Eat Cake, said the queen.

With that he shows how he is divorced from rfeality.

The flea markets are loaded with 8088 machines that sell well
for about

150 bucks and get people started on computing who haven't BEEN
to

college to learn the show.

This is the same kinda guy who says if you aint't got the latest
and

greatest

you are kidding yourself, while all around him, others do it
better

and cheaper.

In one place, he says it must have been poor quality radio, and
in another,

he

says he didn't badmouth me, and in another he says
he didn't

think I knew

what I was talking about.

Hoo, boy.

Ciao.

Lou Hinshaw

Next thing for me to do is be kind to sorts like this, but mostly
myself,

and

Hi Bill.

Well now, a number of years ago, I stopped purchasing a new handbook

every

year after having done so for many years and paying for a new
book

only to

get 5 percent of a new book. The rest of it was in my old handbook.

I

guess that was the first time I realized that there wasn't any
tooth

fairy, no real santa claus and ham radio started to look just
a tad

jaded.

Now I've got a 1991 handbook (purchased) in the shack, and a 1988
handbook

(purchased) in the shop, and maybe, if I like the cover of the
one

next

year, (You never get to look inside before you buy them you
know!)

I'll

buy a new 1998 and move the 1991 to the workshop. It's about
as frequent

as I get anymore.

I'm sure I'll enjoy your contribution to it, and maybe a few of
the

others

who labor so hard to provide a little payback for their hobby
of so

many

years, but at the current price, it had REALLY better be good.

Meanwhile, back at the ranchhouse, in MY copy of the handbook,
the index

leaves something to be desired.

I don't bother with MIME'd messages, so not real sure about your
comments,

but reading between the lines, figure it was something about
the Cu

wire

tables

From: kr4wm@sccoast!.net (Web Williams)

Subject: How do you connect LED's in parallel?

I'm working on a project for a friend, and need to connect two LED's

in

parallel. When I hook them up, only one lights, the other just sits

there. I'm supposing that the one which draws the most current is the

only one which will get any current through it, or something like that.

Don't need to understand the theory, just tell me what I need to know

to

get it working- please. We'll discuss why this happens in another message

thread- it's Saturday night, and I have to get it back to the owner

on

Monday morning (hopefully in working condition). No, it's not something

I

broke. It's a clock with an ambulance on the face, and the ambulance

has

three LED's for emergency lights. You push a momentary contact switch,

and the LED's alternate, i.e. Two parallel LED's light at one time,

then

go out, and the third light comes on, and they do this back and forth

contunially. At one time, it worked like this from the factory (who's

out

of business). I had to home brew a siren and this light system

without the benefit of having the old circuit to look at. This is

something I'm rigging up for the owner, who likes flashy stuff.
Thanks

in

advance for any advice- 73, Web- KR4WM in Myrtle Beach, SC

They also sell a silver plated version that is more expensive ($3.99),

part number 278-188. Also a UG-176 reducer for RG58/59 (2 for 99 cents),

part number 278-204. I have used these parts OK.

From: markem@primenet.com (M. Monninger)

Subject: PL259 Attachment to COAX Cable

Most of the mail order connector/cable outfits have teflon/silver PL-259's

for

$1.00-1.50 each depending on qty, even cheaper if you buy lots of 10.

The

silver plated adapters go for 25 - 30 cents each. The silver-plated

259's are

MUCH easier to solder and if you're using the adapter for RG-58, they'll

suck

the solder right in and give a great connection to the cable. Of course,

my

old Weller 350W gun helps a little too...

## 1911. Knight kit T-60 grounded cathode?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-17 00:00:00 UTC
From: kr4wm@sccoast!.net
Message-ID: <MPG.e6108b6236d12659896b0@news.infoave.net>
Source record: 91680

Hello fellow amateurs- I'm seeking help again with another project. Not quite sure what I'm going to do with it just yet, am thinking about using it for a 6 or 10 meter propagation beacon. Anyhow, my problem is this: it won't transmit. Now, I know what you're thinking- how am I going to help this guy diagnose something with this broad of a description? It's hopefully going to be easier than you think.

Question #1: There's an unlabeled switch off the back of the set, any idea what it's for?

Question #2: There's a small choke running off the cathode of the 6DQ6B final to a pin of a jack on the rear panel. This jack is un-numbered, so I don't know what pin is pin #1, but for indexing purposes of this posting, we'll call it pin #1. There's a wire going from pin #1 to the cathode of a triode inside a dual tube (has triode and pentode inside same glass, and is a 6HF8). I'm assuming that I need to make a jumper from pin #1 to pin #2, which goes to the key jack on the face of the radio, without which the cathode would never be grounded, hence will never transmit.

Question #3: Possibly I need some missing part that plugs into the jack, completing some other circuitry inside the transmitter?

Question #4: There's 557 volts DC (measured) on the plate of the 6DQ6B. The 1967 ARRL handbook tells me that there should be about 250 volts. Am I measuring wrong? If I ground the cathode, will that "pull down" this voltage to normal limits?

I guess what I really need is an owners manual- so if anyone has one, I'd appreciate a copy. Yes, I know about Hi manuals and the other manual company, so please don't bother telling me about them. We homebrewers are a CHEAP bunch, aren't we? I'll be happy to pay copying and mailing costs.

73, and thanks in advance for any assistance-

Web Williams, kr4wm@sccoast!.net

Instead of using one resistor in series with a parallel combination of
two LEDs, use an independent resistor on each individual LED.

# 1914. REGEN SW ANT AMP for small SW RX ant in Apts

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-17 00:00:00 UTC
From: "P. Singh" <singhpk@NOSPAM.exit109.com>
Message-ID: <33F73C5A.3537@NOSPAM.exit109.com>
Source record: 91683

I live in an apartment and can at most use a small 10 foot wire out
of the window to receive Shortwave weak signals. So I have a need
to boost the signal without being drowned by out of band megawatt
transmitters.

An regenrative receiver coupled to the ANT of my SONY ICF 2001
did the trick. It boosts the signals upto 5-7 S points while
providing a lot of front end selectivity . That keeps the
out of band signals out.

The regenrative receiver is tuned to the frequency and has the
regeneration set to just below the point of oscilattion.
The tuning is very sharp, 3 KHZ or so.

Has any body had a similar success/experience with this
method of using a regenerative receiever to boost the signal
strengh and front end selectivity of a SUPERHET receiver.

I believe that this gives you the best of both, i.e.
Very high selectivity and stability of the superhet and the
very high sensitivity of the REGEN RX + more front end selectivity.

Please let me know what you people think about.

Just built one of those! ... well 48.5 cm actually ...
Mounted the coax inside 1/2" PVC with a cap on the top. Fixed the end of
the center connector to the cap and sealed the bottom with hot-glue.

This made a pole about 100 cm high. Fixed to the side of the roof with a
couple clamps. I can now hit the repeater (about 25 miles away) with
2wt.

Time to build, install, etc. ... less that 3 hrs.

Now....does this kind of antenna have a name?
1/4 wave vert dipole stuffed inside PVC ... a bit long winded 8)

## 1922. Updated Pages

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-17 00:00:00 UTC
From: Geoff Brown <equinox@itl.net>
Message-ID: <33F7B803.A81AD91C@itl.net>
Source record: 91691
Cross-posted to: uk.radio.amateur,rec.radio.amateur.homebrew,rec.radio.amateur.dx

At long last we have now updated/added many links and our own pages re
50MHz.
The 50MHz News pages is still hitting around 1000 hits per day and now
includes the previous days Solar news from DXLC.(very accurate news!)
There's also the start of a 50MHz DDS CW/SSB TX/RX as a winter project
with many additions including, Super Keyer 3, Digital Voice Recorder,
Audio Bandpass filtering, digital Display etc.....
http://user.itl.net/~equinox

# 1923. Re: Knight kit T-60 grounded cathode?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-17 00:00:00 UTC
From: Ed Cummins <MrMicro@techie.com>
Message-ID: <33F75240.7614DA0@techie.com>
Source record: 91692

I havea T-60 in my collection. The previous owner was kind enough to label all of the stuff on the rear of the chassis.

Q#1. The switch on the back is marked "meter sensitivity".

Q#2. The accessory jack on the back has pins 4 and 5 jumpered together. This puts the cathode of the final amp on the key jack at the front panel. With nothing plugged into the key jack, it should transmit when the funtion knob on the front panel is turned to "am" or "cw".

Q#4. My T-60 has about 500 volts on the plate of the 6DQ6B. Your 557 volts should be ok without a load on the tube.

## 1924. My quest to connect LED's in parallel ANSWERED

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-17 00:00:00 UTC
From: kr4wm@sccoast.net
Message-ID: <MPG.e612d1f4b826da89896b2@news.infoave.net>
Source record: 91693

I'd like to thank all who replied to me with respect to connecting LED's to a common supply voltage. One fellow (Allan Butler of Inter Access Internet Services of Cedar Rapids, Iowa) suggested that I connect the LED's in series instead of parallel, and that cured my problem. I suppose LED's are current-driven, rather than voltage-driven. This configuration divides the current equally between them, since current through one LED must equal current through the other one (in a series curcuit). I appreciate the lesson!

Several suggested using separate current-limiting resistors on each LED. I'm sure that would have worked, however, a drop or two of solder wiring the LED's in series did the job instead of digging in my junk box for a couple of resistors. Go figure!

Thanks Allan! 73 all- Web Williams, KR4WM

You can get them both to light simultaneously by inserting the
suitable current-limiting resistor in series with each lamp.

While I agree that this is the case for noise and interference
generated in the far field (several wavelengths away from the
antenna), I would not be too categorical about interference generated
in the near field of the antenna (much less than a wavelength away).
Unless you know the current and voltage distribution along the antenna
in the untuned and tuned case, it is hard to predict how local
interference is capacitively and/or inductively connected to the
antenna and then into the receiver. So tunning the antenna _may_ have
some effect on the susceptibility to _local_ (near field) noise, so
in some cases you might have some S/N advantage of tunning the
antenna.

Many LEDs drop about 2 volts at their maximum current. If your source is only 5 volts or less you may run into problems assuming an LED drop of zero volts.

You may need a tuned pre-amp between the antenna and the
mixer to get the noise figure down to a level that works
well.

I have used a Radio Shack PRO-2004 scanner in the wideband
FM mode to hear these satellites using the scanners built in
whip antenna. Find one of those or an equivalent and save
yourself a lot of work.

Howdy. I was given an HP180D dual trace scope, and
found that the horiz. trace is starting from about
an inch from the right hand side of the screen.

Havent been able to find any adj on the horiz sweep
board etc.

Does anybody have any information on this adj
or better yet, I'd like to get a manual for
this thing.

Thanks in advance,

tony

Pavle OM,

Another way to make electrical connection from top to bottom of PCB is
to
use small brass eyelets. This was (and still is) used to make reliable
thru-hole
connections with simple two-sided etched boards.

This is what happens when too much of the original post is clipped.
Yes, you're not the first to suggest a portable welder.
But I need to drive this off the crank or prop, I don't want to have to
carry a genny in the back of the van.
Lestek alternators in Texas have contacted me saying they produce 48V
units so even if I have to strap a pair of 100A units together that
should do the job nicely.

Be seeing you.

You could try Manuals Plus, but I paid $120 to them for an incomplete set for my Tek 7704 plus plugins. If you can't find them anywhere else, you'll have to fork out the dough. I don't have their web address- maybe someone else will.

Rob.

: I wish I would have thought of that when I had my SB-101, about 23 years
: ago. At that time, I thought the crystal filter was going bad. But I bet
: it was just crystal drift.

: Rob.

They drift, AND they go bad. There has been a lot of
stuff written for the HW-101 and when I restored mine
(bought it here on the internet- the usual "worked the
last time I turned it on"...) I was able to weed thru
no less than 8 major problems... one of which was
that I had no lower sideband and ended up finding a
crystal someone pulled from a junker. The 101 is
supposed to be notorious for bad crystals, not only
for the sideband selection, but for band selection too.

Resistors can go way up out of tolerance as well.
The one good thing about these old rigs is that when

you get one with a lot of problems and have the patience,
you will learn a LOT!

Good job!

All you need to do is connect a small value resistor in series with
each LED. What you want is about a 200-300 millivolt drop across the
resistor. If the LED draws 20 ma for example, the resistor would be
10-15 ohms. Since you probably don't know the exact current drain or
the extent of the mismatch between the LEDs, a certain amount of cut
and try will be needed, but 10-15 ohms is a good place to start.

> from my address.

I do not have specs of your receiver, but I agree with Gary KE4ZV: the
pre-amp for your HF-RX should not make a difference, since there is no
improvement in SNR (N being mainly the atmospheric noise on HF).

More likely by adding the pre-amp you overload the input of your
HF-receiver with too strong signals, thus creating stations as products
on frequencies they never have been.

I.e.: by non-linearity in the high part of the dynamic range (1 dB compression point etc.) of the receiver reciprocal mixing occurs. As a result frequencies are generated as (f1+f2) and (f1-f2), but also higher-order products.
The operator will now notice stations on frequencies never radiated by any transmitter, so on a different location in the frequency band.

>only one which will get any current through it, or something like that.

Just use separate current limiting resistors for each LED. Or, if
that's not easy, add a series resistor to each LED. In the latter
case, assuming there's a single current limiting resistor somewhere,
100 ohms in series with each ought to force them to share the current.
Be aware that even at identical currents two LEDs might not have the
same brightness,

Jim Potter

->All you need to do is connect a small value resistor in series with
->each LED. What you want is about a 200-300 millivolt drop across
the
->resistor. If the LED draws 20 ma for example, the resistor would be
->10-15 ohms. Since you probably don't know the exact current drain
or
->the extent of the mismatch between the LEDs, a certain amount of cut

->and try will be needed, but 10-15 ohms is a good place to start.

->73, Bill W7TI

Bill--Wouldn't it be safer to calculate the R value thus:

Assume the drop across the LED to be zero and the current through the
LED to be 20 mA. (These are super-safe values...)

Calculate the resistor value to be source volts/LED current.

If the source voltage were 5V, then
R = 5/.02 = 250 ohms.

If the source were a single alkaline cell at 1.5V, then
R = 1.5/.02 = 75 ohms

## 1942. micro power source needed

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-18 00:00:00 UTC
From: w1_k_sorter@qsl.net
Message-ID: <5t9p9j$2hl@news2.tds.net>
Source record: 91700

My friends,

I have need for a somewhat specialized power supply and haven't been able to find the answer within the PM Tube industry, so I thought I would run it up the flagpole here, so to speak.

Power supplies for PM Tubes are VERY EXPENSIVE and Hamamatsu makes the power supply I need (almost). They have developed the Cockdroft-Walton multiple stage voltage doubler power supply, but refuse to make it available in a form that can be utilized for non-Hamamatsu PM Tubes.

So, I am currently searching for an alternative to the Cockcroft-Walton supply, the most obvious solution is to RUN THE TUBE DIRECTLY from batteries.

---

I need a power source as follows:

Each stage needs to supply (about) 100 volts DC at picoamp to 100 microamp amplitude (100 microamp current draw would be VERY RARE, typical operating current draw is less than 5 microamp, and the tube will spend 99 percent of it's life drawing 10 picoamps or less).

10 of these stages are needed to produce voltage taps at 1000v, 900v, 800v, 700v and so on, down to zero volts.

---

My first thought was to check out the nicad battery suppliers, but they only have 1.5 v and 9 v cells, and they don't have any miniature versions. I could not find a single vendor who had any interest in anything other than 1.5 and 9 v cells.

In light of the VERY MODEST current demands of the PM Tube, I wondered if it might be possible to actually fabricate small electro-chemical batteries on a printed circuit board (or similar technique) and to then put the boards in series when needed. Obviously, lead-acid as used in car batteries would be a good place to start, but each cell needs its electrolyte to be physically isolated from the other cells, making microfabrication somewhat more complicated.

I do not run the PM Tube often, so I don't mind if the battery stack requires some occasional maintenance (a maintenance free 'battery' is not required).

I'd love to find some ni-cad watch battery sized cells, they are stackable and rechargeable-but they just aren't available.

Any ideas from the group regarding how to make compact low current dc power sources by using electrochemical reactions?

I do need the power source to be reasonably compact.

thanks de K

Jim,

I agree with the low cost approach. My attempt will be to
modify an old (cheap) scanner to have the appropriate passband. I'm
just trying to figure out the insides of a uniden 210xlt scanner to
bypass the filter section and see how that works.

Let us (me) know how your attempt works :-)

Tony,
You really do need the manual because the fault you describe could any number of things ...
There are x1, x5 and x10 horiz gain adjustments, three presets in a vertical line top left of the horiz amp board, they are marked on the pc board, but I wouldnt touch them without checking the supply voltages first, starting with the 100v rail which acts as reference for the others...
The eht supply can affect the deflection sensitivity as well.
Manuals, or good copies, are available from Ed Matsuda, phone 619 479 0225.
Don't forget, your problem may be with the horiz plug-in also, these have separate manuals.
It's worth persevering with the repair these are good scopes, different plug-ins (4 channel, spectrum analyzer, network analyzer) are available quite easily at swap-meets, and no exotic bits needed to repair them.
Good luck,
Dan AC6AO//G3NCR

There is a method I have long been tempted to try for plating through holes.

Many older astronomy freaks know how to silver mirrors. You can find a recipe in the Handbook of Chemistry and Physics (CRC). IF YOU ARE TEMPTED TO TRY IT PLEASE FOLLOW THE SAFETY PRECAUTIONS!!!!
Anyway, if you deposit this silver on a well cleaned surface it sticks fairly well and will even deposit on a surface facing downward. Of course it will be everywhere, including on the copper foils; I propose wiping this off with some kind of abrasive like Scotch-brite, which ought not get out any of the silver in the holes.
Then plate generously with copper from a non-acid solution; the industry commonly uses pyrophosphate baths (Diphosphates). These have good throwing power (they plate in places with restricted access, like the holes!) and have low toxicity.

One tip is to experiment a little with getting the silver to deposit in the holes. I do not remember if you are allowed to move the substrate during silvering but forcing liquid through the holes could be beneficial.

On the safety issue- silvering this way is safe if you behave sensibly, but if you ignore the rules you often get an explosion which spreads eye-damaging chemicals around the room. It is particularly bad to store the baths after the silvering is finished- I have a cabinet in which someone deposited his leftovers- It is coated with the wastes from his explosion, which fortunately hurt nobody. Working at higher temperatures is also dumb. WEAR GOOD EYE_PROTECTION!

Good luck- if you don't try it, I will.

>segment at each corner mounting screw-hole, 90 degrees from the center
>conductor.

Personally, I would agree with you,

But:
The ground plane usually works first time and you do not need a SWR-meter
to tune it. So building it is not as interesting as building a J-Pole, where
you can do a lot of tuning, adding chokes, baluns et.c. and be proud if
it finally works, because it might be 1/10 dB better than the simple gp.

Also, with a good plug and socket the gp is water proof first time,
and will not be such a rewarding challenge to ones plumbing skills.

Moritz.

Personally, I'm not sure DSP as implemented in current ham gear is so
great, but if it compensates for design deficiencies elsewhere and
makes the overall performance satisfactory then what's the problem
with that.

I thought it was the bottom line that counted, not how you got there.

I've run into this same sort of problem. You need an isolated supply for the voltmeter since they usually can't handle an input voltage referenced to their own power supply. You have the right answer, a DC-DC converter. Fortunately, the computer folks use little dc-dc converters to make the -9V used for LAN work. This means that these converters are available cheap (under $5 apiece) from the surplus places. I think I've seen them in Hosfelt or Marlin P. Jones. In any case, you *can* make a DC-DC, I had to late one night when I had to have the circuit for the next day to go out of town. It works fine, but it was more than $5.00 worth of hassle. I used a tiny audio transformer and drove it with a couple of transistors in a push-pull circuit. Now I'll just keep some of the commercial surplus dc-dcs around. Make sure that the converter is truely isolated though, and not referenced to the input side of the converter. I've seen both kinds for sale.

Ferric Chloride users:

Made some MAJOR progress on my homebrew superhet receiver (20 meters) this weekend. Finally built a proper frequency readout. It consists of the circular part of the coffee can that is normally thrown out right after you smell the Folgers. With an old junk-box Jackson 6:1 reduction drive (out of a Swan 240!) and some scrap aluminum it is now providing me with far more frequency info than I had before. (Before I had to peer over the front panel to eyeball the tuning cap!).

I went ahead and built a little grounded gate FET pre amp circuit. The circuit comes out of W1FB's Design Notebook. It has really improved receiver performance. Before I could not hear the band noise - now I can. More important, however, is that it's two tuned circuits have completely knocked down the 22 Meter broadcast band spill over. So I no longer have to listen to fundamentalist preachers or Radio Canada International while trying to copy DX stations. Like I said - MAJOR progress.

I have one problem that I would like to ask the group about: As I tweak the two tuned circuits (input and output) in the pre amp, it breaks into oscillation whenever I put them both at their resonant points. If I back off a bit on the input tank, the oscillation goes away, sensitivity remains sufficiently high and the 22 meter gang continues to be blocked. I suspect I may have failed to use a sufficiently short PC board trace to ground for the FET gate.

Anyway, is this worth fixing or should I just leave it as it is? Is it normal for grounded gate FET preamps to behave this way? Am I losing performance by operating the input circuit slightly off resonant frequency? Can someone explain WHY this circuit is doing this (Too much gain? Why would the lead length matter?)

Thanks, 73 Bill N2CQR

Try testing the oscillator maintaining circuit with a "synthetic"
crystal. Construct the synthetic crystal from chip components consisting
of a series C say 1000pf (to remove DC) in series with a 120 ohm
resistor paralleled with a 5pf. This synthetic crystal represents the
equivilent circuit of a worst case in spec 5th overtone at the required
frequency. Your circuit should then oscillate within a few percent of
the crystal frequency. If you have an out of spec crystal the most
likely problem will be that the crystal has a higher starting resistance
(can be 2 to 300 ohms) than when it is running at say 100uW

# 1959. Re: J-Pole

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-19 00:00:00 UTC
From: jamesh@trib.com
Message-ID: <5tbmh9$1m9@news.trib.com>
Source record: 91579

Just to add fuel to this thread, and since I really want to know what I'm doing wrong:

I built the J-Pole as shown in the 1996 ARRL Handbook. I used the exact measurements shown. This is a copper plumbing sort of unit. The antenna works great. (even better than my cheap-o piano wire 1/4 wave ground plane). The problem is that it can't seem to be tuned up to a 1 to 1 SWR as the book claims it should. The best I get is about 1.7 to 1. Not terrible, but pretty bad for a 2 meter antenna. (The 1/4 Wave ground plane is as near to 1 to 1 as I can read on any meter I have with no tuning, just the standard dimensions.

I have tried this with the antenna mounted in different locations to be sure it wasn't being affected by nearby objects, etc. I have also tried it with and without a balun (several turns of the RG-58 about 8 inches in diameter). No luck.

I built this antenna just as the book says, but, the book shows lengths for pieces before soldering it together. This means that if the caps, tee, elbow, etc don't have the same depth of seating for the tubing, the end-result dimensions will not be the same as they were for the unit in the book. I really wish they would have just shown the finished dimensions of the antenna. That way anyone could cut the pieces to arrive at the proper lengths and spacings.

If anyone has built one of these and had it tune up to a good low SWR, I would be interested in knowing what their final dimensions on the unit were. Also, it seems like the method of running the feedline to the attachment points should have an influence on things. This is a subject that the book failed to address. The coax being right in the area of the matching section probably throws things off. Perhaps I should be feeding it in from a right angle to the antenna. I could build a plastic support to hold the coax out so it could come in at some angle.

Another question is about the piping below the "J". Can this be any length? I'm hoping that the matching section makes anything below it just "dissappear" as far as the antenna is concerned. I am using another 5' section of the copper tubing heading down from the "tee" to provide a mounting pole for the antenna. If this section is being "seen" by the antenna as a parisitic element of some sort, I can see how things might not ever tune up. And, since this piece may be connected to still another section of pipe as a support for the antenna, things would be even more complicated. Please say this isn't so! :)

As good as this antenna seems to get out and receive, I can only imagine that things would work even better if it were a better match to the line and transciever. I want to build one to put up on the roof of my office, but I'll need to run a fairly long feedline. If the SWR is this bad, I'll have considerable loss in the coax. I might go back to a 1/4 wave ground plane for the office if I can't get the J-Poles to tune up. (I also like the idea that the entire J-Pole antenna is a DC short circuit. It makes lightning protection a bit more positive. If only in my mind.)

Thanks for any help.

>greetings // Lars (SM4RZW)

When I worked as a photographer for a local newspaper, we installed a silver recovery system to plate the silver out of our used fixer solution. The large sheets of film used for actually "burning" the printing plates were where we got the most silver. We got hundreds of dollars worth per month. The company from which we bought the sheet film for the line camera bought the silver back from us. It was in a sludge form. Not really pretty to look at, but they just turned around and made more film with it. I understand that places that do X-Ray film get even better production than that. The X-Ray film has to be very sensitive (high ASA or ISO number). To get the higher "speed" in the film, they commonly use more silver. This makes a tidy sum of money for the dentists, doctors, hospitals and clinics that put in recovery units. Not to mention that the local wastewater plant doesn't like the way silver poisons their biological treatment system. Most cities will not let you discharge more than a certain amount of silver into the municipal waste stream.

I believe that color film has silver in it as well. (At least the standard types of color film). And Lars is correct about the silver being found in your used fixer. As he stated, fixing the film or paper removes the "undeveloped" silver. Thus allowing the image to be seen, and preventing the film or print from turning really ugly.

Print papers don't have nearly as much silver as do films since the speed of print papers is very slow compared to most films. If you only did printing, you might not get enough silver out of your fixer to be worth putting in a recovery system.

Ofcourse you can do that.
But if you would have an accepable receiversensitivity you have to add a lownoise preamp in the antennacircuit. The other thing you have to do is to make the bandwith of th conventional FM-receiver smaller (about 40kHz instead of the conventional 150kHz). Further you have to enlarge the Q-factor of the FM- discriminator.(more volts output per FM- deviation. Last action implements enlarging a resistorvalue of the FM-discriminator.

An other way is to look at my homepage where you can find all information for building a receiver yourself.

http://www.qsl.net/pa0axb/

Good luck !!!

alex.

Hi Bill,

Are you sure you measure the voltage at the correct point of the sabilizer
(direct on the sabilizer's output).
You have to account to the resistive losses from the output of the
stabilizer to the input of the DUT (device under test= is your load)

Best regards,
```

# 1966. Fast O'scope for tiny Homebrewer budget

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-19 00:00:00 UTC
From: af389@lafn.ORG
Message-ID: <33F9AAFE.4E3@lafn.org>
Source record: 91586

Hi,
I am still working (having fun) on my Comb and Marker gen ckts for my
HomeBrew Spectrum Analyser. My old trusty 35 mhz scope is
UNUSABLE with comb ckts that narrow pulse width and with the
surplus 100 mhz TTL osc dips I bought. My TTL 74F gates and flip flops
won't operate when driven with these 100 mhz TTL osc parts because,
the osc's are actually output ECL voltage levels. Finally figured
this out by testing on a friends TEK465 scope...marginal
but usable with 100 mhz ECL.

I am desperate for a replacement usable used or new scope, TINY BUDGET,
for checking QRP RF ckts and for checking 100 mhz ECL and TTL logic.
This is for my home shop shack.

What scope are you folks using that are small, light weight for checking
RF and for checking high speed digital logic?

I have looked at TEK 465, 475, 485. I find the probes for a 485
are possibly more expensive than the scope. Sounds like we use 465,75,85
until they need repair, then discard due to parts shortages. This
worries me.

Anyone using a TEK TDS360 or 380 at these speeds? Very expensive
but can print waveform on a Laser printer.
7904 seem usable but are too big for my space.
Any usable TEK 2XXX series at these speeds?
I am use to analog scopes so these Digital Sampling Scopes worry me when
I try to use for analog measurements.

Please list model numbers that work for you. This will be very helpful.

Thanks so very much for any helpful hints and
model numbers to help narrow and concentrate my search.

73, W6MIK

# 1967. Re: Crystals and overtones

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-19 00:00:00 UTC
From: laura halliday <ve7ldh@direct.ca>
Message-ID: <33F9D07F.4128D72C@direct.ca>
Source record: 91587

Assuming you don't have a dud crystal (it happens...), the way
I always set up overtone oscillator circuits is to remove the
crystal, replace it with a 47 ohm resistor, and adjust the
oscillator until it free runs on the correct frequency. Then
remove the resistor, reinstall the crystal, and watch the
lovely stable numbers on the frequency counter.

What circuit are you using? I like the Butler emitter-follower
circuit in the no-tune transverters. Use hot transistors -
2N5179, BFR91, MRF901, etc.

While you can, in theory, operate any crystal on any overtone,
crystals ground for specific overtones will be a lot better
behaved, and may be worth it when you consider the hassle factor.

Use 3.6 or 36 volts on the pot and you can read direction directly from a
digital panel meter or VOM.

TANDBERG used a 4N28 in VIDEO coupler for TV sets. The problem being
that chassis may carry 240VAC phase voltage. LA4WN copied this
optocoubler ccircuit and reported that it performed very well. So it
is only question of how you apply the circuit. For video you need some
large current through the opto device and use some heavy feedback to
reduce nonlinearity.
Current feed for the diode should not be to arkward to connect?

Look at the LEDs as two diodes in parallel and you will realize that it will take an alternating current to light both if there place opposite of of each other. That being one has the anode tied to ground while the other has it s cathode grounded. This should give it an alternating light effect.

## 1974. dc dc converter

I will try to clean up the ASCII ART schematic and repost it.
I am also looking for a tool to draw/convert schematics into JPG/GIF.

A superhet using mixer chips/Crystal filters is a very interesting idea.
May I suggest a regen IF at a fixed frequency like 20 / 24 MHZ
using a crystal instead of the LC circuit I am using.

You could start with a pierce oscilator circuit with a crystal between
the drain and the gate of a fet

This idea of a superhet/regen using XTAL has been driving my crazy for
some time now, and, I would like to try it myself soon.

The advantage of using a superhet with XTAL/REGEN IF are:-
1. 1 XTAL can be used both as a XTAL filter and as BFO .
(DID you notice that I have connected the ANT to the drain
instead of the gate. I would feed the output of the mixer here at
the drain, and, that should improve selectivity/ overload
characteristics a lot.)

2. NO IF AMP/ detector is needed. Some AGC is provided inherently
by the regen detector.

3. Very low power operation. This regen works well at around
1.5 volts!

Possible problems could be:-
OVERLOAD due to very strong signals.

----------message separator----------

> Hi !
> I'm intrigued by your regen rx, but am having a bit of trouble >deciphering
> the schematic, and hoped that you could help me out here.
I need a tool to draw/save the schematic as a gif or JPG.
Sorry for the bad ASCII schematic. The circuit is good though.

> I think R2 is in series between C1/L1 and Q1-gate (?)
Yes, it is 47 OHM stopper resistance to stop VHF parasitics
which are common with (MPF 102) J-fets.

> Q2 appears to collector-feedback audio amp (R4, R5, C4 and Q2-collector
> share a common connxn ?).
Yes, R4 provides feedback mostly at DC, and has little
effect at audio because because r4= 560 K and C3 = 10 UF or so
electrolytic.So, R$ is mainly to bias the Q2 in a table way
with about 2 Volts at its collector.

> R6 (3k3) seems to be in series with the battery - should R5 connect directly
> to +6VDC ?
R6/C5 are used to filter isolate the audio pre amp Q2 from the
following audio AGC amp using LM386 /2n3904 which was not drawn/shown
for lack of time/patience. R6/C5 is needed if you are using LM386
amp after it and feeding both from the same supply.
Without it, you might run into audio oscilations or motorboating.
Incidentally the ten-tec regen has audio oscilations all over the
audio and ultrasonic range.

> Your notes indicate that the hot end of the REGEN control go to R6/C5, but
> the schematic shows it connected to R7/D1 (?).
OOPS, the schematic is correct and the notes are wrong. The hot end of
regen goes to R7/D1.

> (Is D1 just an indicator, or are you using it as a bias regulator ?).
YES, D1 regulates the power to the REGEN transistor Q1 at about 1.8
Volts. Q1 only needs about 1 volt to oscilate even with the very LOW
amount of feedback that is obtained with the 1:10 turns ratio between
L2/L1.

> I think that L2 and R3 are in series between the REGEN wiper and Q1-drain (?)
YES, R3= 100 OHMS. It is used again as a stopper to prevent any
chance of VHF parasitics. ALso, L2 is 3-4 turn link on L1.

> Where does the other end of C6 connect ?
>
GROUND. It is 100 UF electrolytic which bypasses the wiper of the
REGEN so that all wiper noise is not regenrated by Q1.

> The remainder looks straight-forward - it looks like a fun project, too !

YES, the most fun I had in a long time. Also, I have an AGC audio amp
using LM 386 following it.
ALso, I wanted to build a 1 transistor active butterworth lowpass
filter after the Q2 to clean up the high pitched whistles.

Incidentally Bill, I used it as a regenerative RF antenna amp
with a ten foot wire out of my apartment in conjuction with my
SONY ICF 2001. It REALLY pulled a lot of signals for ICF 2001
out of the noise for ICF2001. Signals that could barely be heard
before on ICF2001 were now about (4-5 S points ) on the ICF 2001
signal meter after adjusting this regen.

Also, no internal connections are needed into the SONY or whatever
radio you are using. All you need is the high impedance telescoping
whip on your portable. Connect the regen to it and you have a GREAT
Q-MULTIPLIER / SIGNAL MULTIPLIER at the incoming signal freq.

Let me know how it goes.

P. Singh

The project I am working on calls for a Mylar dipped capacitor. My copy of the Mouser catalog lists capacitors in Ceramic, Electrolytic, Polyester, Polyproylene, and Tantalum. W1FB's Design Notebook also makes mention of Mylar capacitors, Tubular and Rectangular Paper capacitors. What am I missing here? What would a possible source be for Mylar cpacitors? Tubular and Rectangular Paper capacitors?

# 1979. Help rewinding small transformers

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-19 00:00:00 UTC
From: Ricky Ponder <*kc4kin@geocities.com>
Message-ID: <33FA4A65.DAF18C6F@geocities.com>
Source record: 91599

I have two small transformers that I need to rewind. Each transformer has 2 windings of 20 or 21 ga. wire 76 in. long. One red enamel and the other green enamel. First question. Where can I get this enameled wire. I've seen it referred to as Magnet wire before. The second problem,
on the outside of the transformer there's what looks like a bright yellow tape on the outside of the windings. What is this tape and where can it be obtained? There's a split ferite horseshoe that goes over the completed winding assembly that looks like regular scotch tape that holds
it together.

You might wonder why anyone would go to the trouble to try and rewind such a critter. They are a special transformer that drive a florescent lighting circuit in a Heathkit Weather station. No cross reference to anything availiable elsewhere. They want around $60 for these and this is the second time I've had them go bad on me. It seems that as the light bulb gets older even though it still burns it causes the transistors
to draw excessive current. This builds up heat in the area of the transformers evidently breaks down the enamel coating on the wire just enough so that the transformer loses it's required properties. Any help or suggestion would be greatly appreciated.

Thanks,
Ricky L. Ponder

>exact measurements shown. This is a copper plumbing sort of unit.

Sorry, you built the old obsolete copper j-pole. You missed one
small paragraph, and I quote.

"The open stub-fed J antenna shown in Fig 36B can be
connected directly to low-impedance coax lines with GOOD
results. The lack of a movable Balun (which allows some
impedance adjustment) may make this antenna a bit more
difficult to adjust for minimum SWR, however."

I have refined the open stub-fed J antenna for a 1 to 1 match.

Here are the instructions for the Better J-Pole.
Remember, the spacing is important, If you use any element material
other than what is shown here, you may have to change the spacing
to get a low SWR.
Please e-mail me, and let me know how this works out.
and let me know if you have any questions.
You may want to print the page showing the J-Poles at....
<A HREF="http://members.aol.com/Arrow146/index.html">Arrow Antenna</A>
or
http://Members.aol.com/Arrow146/index.html

Construction Plans for the Model J146 2 Meter Solid Aluminum J-Pole

Parts Needed:

Radio Shack # 21-961 3/8"-24/SO239 Mount (Mobile CB Antenna)
Radio Shack # 15-826 TV Mast U-Bolt Clamp Assembly
About 80 inches of 3/8" diameter Solid Aluminum Rod.
5 1/2 inch piece of strut angle Aluminum 1 1/2" X 1 1/2" X 3/16" Thick.
2 Stainless Jam Nuts 3/8-24 thread

Tools needed:

Drill Press with drill Bits up to 1/2".
Tap & Die for 3/8-24 thread.

Sander or file to de-burr the cut edges.
2 9/16 wrenches & a 3/4 wrench.
Vice-grips

Make sure the piece of angle Aluminum is exactly 5 1/2 inches long.
Drill 2 1/4" holes on one side, centered to fit the U-Bolt for mounting.
On the other surface of the angle
Measure in 1/2" in from each end and drill a 1/4" pilot hole.
This should give you 4 1/2" from center to center of the two holes.
Redrill one of the pilot holes to 11/32" Then tap the hole with a 3/8-24
Tap.
Redrill the other pilot hole to 1/2"
Finish as required.

Cut a piece of the 3/8" Aluminum rod to about 59".
Attach a vice-grip to one end.
Using a 3/8-24 Die cut in about 8 threads in the other end.
Screw on the Coupling Nut that came with the SO239 Mount
Tighten as much as you can.
Measure the rod & coupling nut & cut to exactly 57 1/2"

Cut a piece of the 3/8" Aluminum rod to about 21"
Attach a vice-grip to one end.
Using a 3/8-24 Die cut in about 14 threads in the other end.
(If you don"t have jam nuts, cut enough threads for 2 nuts & the thickness
of the angle bracket.)
Screw on one of the Jam nuts & tighten as much as you can.
Measure from the bottom of the nut and cut the rod to exactly 19 1/4"
(Remember the nut must be included in the Measurement.)
(Put a small amount of grease on the threads)
Screw the element into the threaded hole of the angle bracket and tighten.
Screw on the other nut and tighten it.
Attach the 57 1/2" element in the 1/2" hole using the rest of the SO239
Mount.
Mount & test your new antenna. SWR should be < 1.2-1 at 146 MHz and
<1.4-1 at 144 &148 MHz.

This Model J146 is available from Arrow Antenna for only $ 35.
The J146/440 Dual Band with single SO239 feed is only $ 43.
Please add $ 6. Shipping & Handling per order (for US Funds).

Hi all,

In response to a recent posting, I received the following comment:

> I fail to understand why you got more than a slight improvement
> unless your copper was "dirty" before plating. Silver has only about 3%
> better conductivity than copper. On brass I would expect considerably
> more benefit as alloys are usually inferior to pure metals (silver or
> copper.)

To which I replied:

Perhaps our definitions differ. What I think of as a very
significant change might in fact be a slight improvement
to many. Here were the results I obtained:

I plated three separate amplifiers of different designs.
The first was a pair of 4CX250Bs with an all copper plate
circuit (yes, it was clean). Efficiency in class AB1 was
54% before plating and 59% after. In class C it was 67%
before and 76% after.

The second amp was three 4CX250Bs. Mostly brass. Before
plating it was 64% in class C, and after plating it was
75%.

The third amp was a 4CX1000 with a mix of copper and brass.
It was 52% AB1 / 66% C... came up to 58% AB1 / 77% C.
Well, sort of class C... it's tough with a 1000.

They were all 144 MHz amplifiers.

These are not huge increases in power out, especially
thinking in terms of decibels. However, as I was running
them on EME (moonbounce, where every tenth of a dB helps)
it was a lot to me. Also, they ran much cooler and that
was a welcome change.

EME'rs tend to think everything is a big improvement,
because it is... to us. HiHi.

> Thank you for the details; now I must speculate how the
> slight extra conductivity translates into such large improvements
> (3% is far less than a dB and that is in the loss, not in what is
> left after the loss.) I wonder if you want to post your values in
> the hope somebody can explain.

Sounds good. Now I'm curious... let the debate begin... can anyone explain the whys and wherefores???

>without using an ohmmeter?
>Jeff

A very simple method would be to supply a regulated voltage to one end of the position sensing pot, tie ground to the other, then use the resulting voltage from the wiper to drive a mechanical meter. You could use any meter whose full scale current was low compared to the current drawn by the potentiometer alone. Then, pick a resistor value to place between the meter and the pot wiper which gives full scale deflection when the wiper is at the regulated voltage end of the pot.

Now all you need to do is mark the meter with N, E, S, W or some such readings. Perhaps 0 to 360 degrees would be better. In any case, many mechanical meters can be opened up, and a new meter face either made by hand or printed on a PC printer can be glued over the original face. (I like 3M Photo Mount spray for this). Then just put the cover back on the meter. If you do this carefully, the new meter face will look as good as or better than the original.

Now you have a good indicator of your rotator position. In addition, you could then use the voltage from the position potentiometer to drive a circuit which would automatically position the rotor if desired. This could be done by a computer which looks at the voltage and runs the motor, or a simple analog circuit which lets you dial up the desired position on one potentiometer and then drives the rotator to achieve a match.

Hope this is some help

I agree with Norm. This is the easiest way to do it. There is very
little return on investment for PTH in homebrew as this is the least
problem with their reliability factor. PTH will improve the reliability
of a solderjoint in a high temperature cycling environment
significantly. However, all of the other homebrew construction
practices sufficiently reduce the reliability to put this in the noise.

If the originator of the thread is overwhelmed with the idea to PTH.
There is a couple of web sites devoted to circuit board
fabrication...including the circuit board fabrication equivalent of IEEE
called IPC.

What I remember about the process is that the holes are drilled before
you etch and that IN SOME CASES the through holes where filled with
graphite. The board is then dipped in a electroless tin plating bath.
Ralph

Gary Coffman (ke4zv@bellsouth.net) wrote:

(on making a coaxial-sleeve dipole:)

: There's a neater way to do this, Peter. After you strip off the outer
: insulation, push back on the braid. It will loosen like a chinese finger
: trap. Now you can turn it inside out like a sock, *rolling* it back over
: the cable until it forms a 1/4-wave sleeve below the exposed inner
: conductor. This forms a sleeve dipole which offers decoupling of
: the feedline from antenna currents while your approach does not.
: Form a small loop in the end of the inner, attach a heavy bit of twine,
: and you have an antenna you can hoist into the nearest tree. This sleeve
: dipole works at least as well as a J-pole, and is simpler to construct. The
: only material needed is a length of coax.

: Note that you'll have to cut back more than a quarterwave of the outer
: insulation to wind up with a quarterwave braid sleeve, so you'll have to
: trim the exposed inner down to a quarterwave to finish it off. A bit
: of experimentation with the cable you are using will show you where to
: cut the outer insulation so that you wind up with a quarterwave sleeve.
: You can overwrap the sleeve with electrical tape to make a finished
: antenna that can tolerate handling and the weather. Or you can enclose
: the whole thing in a length of heat shrink tubing, that's what I do.

I think the sleeve dipole is a good antenna, but I'd suggest a way to
build a better one. I've made a few of these in the past, with braid
drawn back over the jacket as Gary suggests, and wondered why they
haven't worked as well as I expected. They do work, and they are quick
and easy to build, but they just never worked as well for me as other
simple antennas. A little reflection on the problem made it obvious to
me... The sleeve is supposed to decouple the coax feeline from the
antenna, by being a 1/4 wave section of line between the folded-back
braid and the braid of the feedline going up the center, shorted at the
top end and reflecting back an open circuit to the bottom. But:

1. The sleeve, if it's about 1/4 wave long, doesn't make a good
decoupling sleeve because the coax formed by that folded-back braid
and the coax braid under it, insulated by the vinyl jacket, is more
like 0.4 wavelengths long...because of the velocity factor
introduced by the vinyl jacket. You want it to be 1/4 wave long,
accounting for the velocity factor of the dielectric in there.
But it also must be 1/4 wave long on the outside, to form the
lower part of the dipole... therefore, you need to have a much
lower effective dielectric constant between the sleeve and the
feedline to get it to work right.

2. The sleeve is also not very good at decoupling because the vinyl jacket is rather lossy as a dielectric. That means that even if the length were trimmed to be 1/4 wave, accounting for the velocity factor, it still wouldn't reflect back a very high impedance to where the coax emerges from the sleeve.

3. The impedance of the line you form by folding the braid back tight over the jacket that way is quite low--perhaps 25 ohms. That, too, limits the impedance which can be reflected back. It's a lot better to have a higher impedance, ideally above 70 ohms. (Or -- use a flared skirt like the AEA "isopole".)

It's a bit more work, but I think you'll end up with a much better antenna if you use a piece of copper or aluminum tube for the sleeve. I know it's not as convenient to pack up for camping, and not as easy to construct, but it avoids the poor decoupling problem of the folded-back braid. Suggest using something like a 1" tube with RG-58 feed, assuming the feed line is shorter than 50 feet or so. Make a little "cork" from styrofoam to fit the bottom of the tube, with a hole in the center, to keep the coax centered where it leaves the sleeve. A similar alternative antenna that could roll up a bit smaller is the drooping-radial ground-plane. If you make it from something like 14-gauge solid copper wire, it can be rolled up for packing and then straightened out when you put it up.

If you want to mount a sleeve dipole to a mast instead of hanging it by the upper end, you can make it from pieces of copper water pipe and fittings...use a 1/4 wave piece of 1" pipe over a longer piece of 1/2" pipe, shorted with a reducing fitting at the top, and open around the bottom. Feed the feedline up thru the 1/2" pipe, connecting the braid at the reducing fitting, and extending the center conductor up 1/4 wave. (Or build it so there's a coax connector at the bottom of the 1/2" pipe that you just connect your feedline to.) Then you can support the antenna by the lower exposed piece of 1/2" pipe.

--
Cheers,
Tom

What about a simple Yagi? I'm a brand-new (licenced on 8/19/97) ham.
I built a 3 element Yagi last night using these plans:
http://www.qth.com/antenna/tiny3.htm
I mounted it about 7 feet high to try it this morning when my callsign
was issued.

Build time was 1-2 hours.

I hit a repeater ( WA5OKO in Longview, TX on 146.635 ) 150 miles away
with a Kenwood 7625 2 meter mobile rig. I'm not sure of the output
power of this rig....

>Tom
>tomb@lsid.hp.com

to me it looks like Bill has no rectifier filter capacitor??
or the filter capacitor is defective.
First of all - add another 2200uF 35V capacitor across the possibly
existing (or not) capacitor.
A rather usual similar question is asked by persons using a VOM
reading a specified voltage and they forget that ripple minimum
voltage is too lower for the power regulator to function properly.

ANOTHER perhaps BETTER IDEA if the QRP transceiver is intended for
portable operation:
Design the transceiver to operate at any voltage between 11-24V, a
class A-B power amplifier will operate perfectly well with some ripple
voltage and need not a voltage regulator. Let the input voltage decide
the output power or use some sort of power correction.
Use maximum +9V output from any voltage regulators in the transceiver

>73 and TIA

Most of them don't. Those that do, do it for several reasons. If it's submarine, to get rid of the 1.41 multiplier required for insulation. Often, for mountainous terrain, and in cases of high humidity (think fog), they do it to get rid of corona losses which although a dv/dt problem (Corona occurs at the zero crossing of the AC waveform) is exacerbated by low pressure and high humidity.

Some, like an unnamed Texas Power Company do it to get away from Congress. (In it's infinite wisdom, congress passed a law or rule that required companies that engaged in transmission of AC power between states, to comply with the Federal rules pertaining to equal everything for employees.) TP took their AC to the Oklahoma border, rectified it to DC (With rectifiers!) and piped it across the line, chopped it back to AC (with SCR's!) and sold it to OK.

: Take a look inside a junk TV set. You will find a fistful of slugs
: and ferrite cores.

That would work fine if you'r e building HF gear like ham equipment. But
most of the slugs in the TV set are not made for VHF FM band. If you use
the slugs from IF cans, they have too low Q at VHF or higher freqs.

And it would be okay to use the slugs out of a TV tuner, but it's doubtful
that they have any nowadays.

BTW you're a shameless crossposter, it's wrong to post to so many
non-relevant newsgroups.

>Preston, Ct.

I have not been able to verify this, but some claim that only one conductor is used and the salty water is used as a return path. You would need three conductors isolated from each other and from the environment if normal 3 phase AC would be used.

When talking about submarine cables, they are often connecting different nations with national grids that are not synchronized together, so anyway you would have to make an AC/DC/AC conversion, if you wanted to transfer power between these countries.

DC transfer is sometimes used on extremely long lines (several thousand kilometers) since the free space wavelength for 50 Hz is 6000 km and for 60 Hz it is 5000 km, so the lines are long compared to the wavelength. Transmission line theory must be applied for these open wire feeders :-) and the situation is much more complex than a simple transmitter, feedline and antenna case, since distributed generators and loads are all over the network. In this case it might be easier to control the situation in DC.

I was looking thru my 1990 Handbook and did find an article for the W7ZOI/K5IRK
"High Performance Communications Receiver" p. 30-8

I never built the entire receiver, but I did use the VFO and IF (minus AGC)
circuits as part of another receiver. So if this is the one the original
poster is talking about, he can email me.

The VFO circuit will work well for any high performance design as long as
the tuning ckt Q is very high. Never had any problems with noise even with

very narrow filters.

The IF circuit will work well for modern low gain HDR front ends if an L network is used to match the crystal filter to the first mosfet gate. Otherwise, not good enough S/N.

This IF, along with my own hang AGC circuit was in my own homebrew receiver until the Carver AD600 agc came along, and then I tore out the old mosfet one.

Mylar is a trademarked name (DuPont, I believe) for polyester.
So, a polyester capacitor is equivalent to a Mylar capacitor.
Mylars (polyesters) can generally be replaced by polypropylene,
if you can't find the polyester. But polyprop are more expensive
and larger, generally. They also have lower losses, lower
dielectric absorption, and lower distortion in audio filtering
applications, though you'd probably only notice those things in
critical applications. Don't try to substitute an electrolytic
(or tantalum) for a mylar unless you really understand what you
are doing (or just want to experiment!); usually (but not always)
it's OK to replace a mylar with a C0G or NPO ceramic if you can
find one of the right value, but not with the more common "high-K"
ceramics (Y5V, etc.) used for bypass or non-critical coupling.
Paper caps seem to be mighty rare except as surplus now; as far
as I know, they offer no advantages over the plastic film caps.

Regulating the temperature with a Peltier device would be better than nothing, but not as good as an OCXO. With an OCXO, the temperature is stabilized at the temperature where the crystal's temperature coefficient is zero, or almost zero. So the crystal is almost insensitive to temperature changes (over a small range), and the temperature changes are kept small.

But why use a Peltier device? Why not just use a resistor as a heater, and control the temperature by feedback? There's nothing magic about room temperature. If your crystal is currently on frequency at room temperature, you may have to readjust it at elevated temperature, but that's a one-time adjustment.

Dave

## 2005. Room Temp "Oven" for Quartz?

Source record: 91625

Has anyone done any experimenting with keeping a quartz crystal at room temperature using a Peltier device? I'd like to improve the stability of my HF rig, but don't want to pay Yaesu $100+ for their high-stability TCXO option (a meager +/-2ppm).

I'm looking for a simple but effective scheme to improve stability without spending a lot of money. I'd like match Yaesu's 2ppm while retaining the original crystal. It is 10-point-something-MHz and I'm not likely to find a surplus TCXO or OCXO.

>behaved, and may be worth it when you consider the hassle factor.

I'm not sure what the type of oscillator is, it uses a power (500mW) U310 N-channel JFET, Gate grounded, Source +2V (biasing resistor to ground). Xtal is connected to Source and in series with 82pF to ground, 12pF to Drain. 0.1uH inductor from +9V to Drain, 2.2pF capacitor to MAR3 MMIC (then on to SBL1). Diagram:

```
----------+9V
|
|3 0.1uH 2.2pF
__D----------------||----(MAR3)
| |
---G = 12pF
| |__ 116MHz |
| S-----|#|----
| | |
| {}150Ohm = 82pF
| | |
| | |
GND GND GND
```

As stated I've tested the xtal on a Network Analyser and it definately works, just not in the above oscillator;(there is a better picture in the Radio Communicatiosn Handbook 6th Ed., pub. RSGB, in the Microwaves chapter.). I've been thinking of just using a tansistor (BFY90 or whatever and using a butler oscillator but would like to get the above working (I've already etched the board and don't want to build an outboard oscillator). Apart from the variable inductor (0.1uH) there is nothing else to tune. The inductor is not the same as the one specified, but has an Aluminium core, Q 70 @100MHz and

usable up to 200MHz (Toko S18). TIA

>
>> But why use a Peltier device? Why not just use a resistor as a heater,
The crystal in the radio, while not in a temperature compensated circuit,
should (in theory) have a zero temp. coefficient at room temperature. I
could place the same crystal in a homebrew TCXO, but I'm
>not sure how I would calibrate the temperature compensation. I thought
it might be easier to build a current-reversing controller for the
peltier. It should be possible to heat or cool the crystal in order to
keep the temperature constant.
>-Ken

Regardless of how you stabilize the temperature, the crystal has a
"turnover" temperature. A temperature where it's thermally induced
frequency drift goes through zero and reverses direction. That is the
temperature the oven should operate at. Then, minor oven temperature
variations minimize the frequency instability.

For most crystals, this temperature is between 50 and 90 degrees C, so you
never need the cooling capability of the peltier device.

(Nothing is constant. Even my 12 volt power supply isn't PRECISELY 12
volts. The oven controller has some loop gain. It's not infinite, ((If it
were infinite, it'd oscillate anyway and be unuseable)) so there will be
limitations on the temperature stability you can achieve.)

:I'm looking for a simple but effective scheme to improve stability
:without spending a lot of money. I'd like match Yaesu's 2ppm while
:retaining the original crystal. It is 10-point-something-MHz and I'm
:not likely to find a surplus TCXO or OCXO.

There's an electronics place here in Portland OR called Cascade Surplus.
They had lots of temp controlled crystal oven modules, with schematic
included. I don't know if they still have them. Their # is 503-285-0832.
Sold them for a couple bucks. I also don't know if they will ship mail
order. I've also seen the same modules in some other surplus catalogues,
although I don't remember which.

I used the double insulated boxes for building weak signal generator and
IMD signal generators for dynamic range testing. Threw the insides away.
:)

# 2013. Heathkit Clock GC-1720 Wanted

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-20 00:00:00 UTC
From: "Mark L. Bary" <mbary@erols.com>
Message-ID: <33FBC821.EF8@erols.com>
Source record: 91633

Hello,

I'm looking for one or two of the above 'wall' clocks in good working order.

These clocks are about 6"x4" with an LCD display of about 1.2"x3" and the numerals are about 1" tall. Mine has a brown man-made material as the 'case'. Power is supplied by a single AA Alkaline battery.

If you have one of these and would like to sell it please reply via email.

Thanks for reading this & 73,

Mark

Germantown, MD

# 2014. Shared 2-meter / Broadcast Mobile Antenna?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-20 00:00:00 UTC
From: John Baxter <jbaxter@voicenet.com>
Message-ID: <33FB9865.B458D83D@voicenet.com>
Source record: 91634

Does anyone have suggestions for designing a circuit to allow sharing a 5/8 wave two-meter mobile antenna between a 2-meter transciever and the car's AM/FM broadcast radio?

The system I now use has a simple A/B switch. The antenna is correctly matched for the two meter band, and operates as a compromise antenna for the car's AM/FM broadcast receiver. I try to always remember to turn off the broadcast radio when using the ham rig - RF can get into it even if it is switched out of the antenna circuit. (I can't imagine why!!! 45 watts within an inch or so... :)

I'm just wondering if there is a straightforward way to isolate the AM/FM radio from the 2 meter rig, while leaving it connected - and passing signals within its bands. Obviously this is possible - the duplexers used for repeaters share and antenna between a transmitter and receiver with frequencies which are very close. But I'm looking for something a whole lot less involved to keep 2 meter RF out of a broadcast radio.

Perhaps a (very) steep notch filter, and back-to-back diodes to help protect the broadcast radio's front end? Any thoughts?

Thanks and 73...

John, N3FPZ

>Spencer
>W1GAK
>Preston, Ct.

In southern California we get some of our power on DC lines from Oregon. I got to visit the southern terminus of it many years ago. What they told us then was, as best as I can recall, to avoid skin effect. With the high current flowing through the wires, skin effect is a problem even at the low frequency involved.

They also mentioned that they do not use ground as the return path. One of their two wires failed and a temporary operation using the other wire and ground caused worms to crawl up out of the ground all the way from southern California to Oregon! Honest! That's what they told us.

As another note, I am told that many of the AC lines carrying high power 60Hz are hollow, to reduce weight and since there is skin effect, losses are not increased much.

I think power factor is correctable, so it doesn't seem like the reason.

Caveat Emptor. I'm not an expert.

Hi Spencer,

I have an addition to my previous response.

> What kind
>of equipment is used to transform from AC to DC and DC to AC?

The conversion station I saw used, as I recall, thyristors, which are giant vacuum tube equivalents of SCRs. They were controlled via a simple optical link that was isolated from the high voltage. The banks of thyristors were on progressively taller and taller insulators, as they went down the building, each seeing higher and higher voltage. They were triggered in sequence to SYNTHESIZE the AC sinewave. A substantial section of the plant was lowpass filters (For 60 Hz!) as the synthesized sinewave was comprised of, maybe 10 steps or so. With so few steps, they had large amounts of harmonic energy above the fifth harmonic of 60 Hz.
The whole plant was surrounded by a shield that looked like a form of chain link fencing, except that it covered the entire outside including over the roof. This was to contain harmonic radiation.

The thyristors could also be used dis-assemble the AC into DC, essentially a synchronous rectifier. The conversion station on the Oregon end of the wire was identical to the one that I saw.

Again, this is my recollection from over twenty years ago when I visited this place on an engineering school field trip.

I am trying to locate a PNP transistor with highest available VCEO value, ideally up to 1kV.

ICmax or Pw is not too important, neither is hFE.

So far I've found transistor 2SB832 (at the TDS-NET Web site), but it does not seem to be available anywhere in North America.

Any advice would be greatly appreciated.

Thanks

> 2m or 70cm. I haven't come up with anything. If someone out there
> could point me in the direction of measurements, the equations, or a
> piece of software it would be a big help.
>

Hi!
Is this what you're looking for:

Design:
-----------
YA.EXE Yagi Analyzer, PC-program for modeling yagi arrays.
Copyright Brian Beezley, K6STI.
I found it in the ARRL antenna book..

YO.EXE Yagi Optimizer, bigger program by K6STI

I built a 6-element Yagi on 70cm, based on those programs.

Measurement:
------------
I put up a RF generator with a simple dipole antenna. 13
meters away I put up the antenna under test. I used a
sensitive level meter (actually, a spectrum analyzer) to
measure the received signal at different azimuth angles.
Then, I could draw the measured antenna pattern om my PC.
I cannot tell the exact gain, but the pattern was very
much like the theoretical pattern from the YA.EXE program.

So, I am satisfied..

# 2024. Re: Capacitors

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-20 00:00:00 UTC
From: Jim <jstrohm@taxes.net>
Message-ID: <33FAA3B5.6668@taxes.net>
Source record: 91644

Polyester and polypropylene may substitute, as may silver mica.

Two concerns -- what is the capacitor being used for,
and what is its physical dimension?

If it's a close-tolerance audio-frequency application,
polypropylene may be a better choice. If it's RF, it
depends on frequency. If it's DC bypassing, you've
got a different set of constraints.

If it's the R2/T2 project from QST, __USE THE EXACT
PARTS SPECIFIED__. There are some heavy-duty physical
constraints imposed by the circuit board, as well as some
heavy-duty tolerance constraints. Oh, and you'll need to buy
like 10 each and hand-match the parts.

So your answer is, as with practically everything in homebrew:
"It depends."

Alternate sources include Digi-Key and Newark (who has a big
minimum order...).

I am interested in amateur radio. I am from Ontario, Canada. I would appreciate any help that somewhere from this area can give me on assembling the minimal equipment required to get started, so that I can learn from experience, and build on the original assembly.
Thanx ALOT!

B. Hart

## 2026. re: taming HF preamp, why

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-21 00:00:00 UTC
From: "P. Singh" <singhpk@NOSPAM.exit109.com>
Message-ID: <33FC8C8C.6878@NOSPAM.exit109.com>
Source record: 91513

Tapping down the drain on the output tuned circuit
mismatches the drain to the output tuned circuit
impedance.
Mismatching reduces the circuit gain without affecting
noise figure or selectivity.

This reduction in gain is just enough to stabilize your preamp.
Reduction in gain is not really harmful because RF preamp
gain should just be enough to give you a good Noise figure.

Also Noise figure is not very important at HF.

For more design information, please look at the motorola
RF design manuals.

pk: Thanks. The tuned circuit on the input side was already tapped
down.
So I went ahead and tapped down the tuned circuit on the outpt side.
went
about one quarter awayf rrom the top - this wasn't enough. The circyit
still oscillated. Tried again and went about halfway down. This did
the
trick. Oscillation stopped. Gain was reduced a bit (as expected) and
the Q
of the tuned circuit increased a lot (it it now a bit difficult to tune
and
only covers a small portion of the CW band.

Can you explain how/what this tapping down had eleiminated the feedback?
I'd like to understand what is going on.

I think the preamp has had a very positive impact on rx performance.
But

I'm a bit disappointed to hear the 22 meter band shortwave stations are still invading my RX. I wonder if the proble is somehow related to very strong broadcast band (AM) stations in the vicinity of my QTH. What do you
think?

I do a lot of hobby boards and my employer's prototypes on a milling
machine. Typically I drill the holes first (before etching or milling)
then take the board in the back door of a cooperative board house
for plating. If I am in a hurry or if the board house is too busy to
deal with me, I use small brass or tin eyelets that I get at the
local hobby/model shop. They are easy to push in and solder and
require no cutting or trimming unlike wires.

:Most commercial ham equipment have terrible receiver performance. Thats
:why they need DSP so bad.

Saw someone who was questioning this on DejaNews. Unfortunately, primenet
is somewhat behind in news. Name was Wes Stewart.

Dear Wes:

Please check out the Sherwood Engineering homepage. It speaks for itself.
So much so, that I was very shocked myself to see just how awful modern
Japanese transciever performance was. Compare this page to the
"happy-go-lucky" ARRL reviews of the same equipment. Pure Embarassment.

Dont Blame me, I'm just the messenger, Rob.

## 2029. help: 2 rotor control question

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-21 00:00:00 UTC
From: David Williams <david.w.williams@trw.com>
Message-ID: <33FCB1F7.378D@trw.com>
Source record: 91516

I see references to a SASI Sat tracker that hooks to a PC parallel port.
Where might I get more info on this device. Is there an interface spec
available if I wanted to build my own interface that is compatable?

Is there a "standard protocol" for sat tracking programs' output?

Thanks for the help -David KF6IB

Content-Transfer-Encoding: 7bit

The regen Circuit and the audio amp ckt is reposted

below as requested .

Sorry for the (less than) clear ASCII schematic posted earlier.

```
------------------------------|

| |+ REGEN-----R7-----------R6-------+6VDC

| --- GND | | | |

L2 --- C6 -- |+ | | +

| |GND D1 | ---

| --- | R5 --- C5

| GND | | |

A-||---------R3---------- --- | ---

Ca | D | + To Input

G |--- |----+-----------| |----

------------R2-->| Q1 R4 |C | C7 of LM386

| | |--- S + | |/ | Audio Amp
| | |---------| |-----| Q2 |

| | | | C3 B |\E C4

L1 C1/TUNE R1 --- | |

| | | ---C2 | |

GND__|_______|_____________|____|______________|____|_____________ 0V
```

NOTES:

GND means Common (chasis ground BUS) reference point.

L1 = 40 Turns (AWG 26) on T-50-2 red ferrite toroid.

L2 = 3 (3-4) turns link on L1

The turns ratio between L1:L2 should be about 10:1

A= Antenna connection. Yes antenna is connected to

the drain of Q1. This gives excellent performance

even with a 10 FT antenna

(Connecting to gate of Q1 will overload the regen

and the performance will be very bad.)

Ca= 100 PF ceramic or so. Antenna coupling cap.

C1 = 90 PF johnson tuning cap with gearing and reduction.

try 40 PF - to 365 pF( the reciever works well with any

of these, though the coverage will be modified appropritely)

Coverage will be 5MHZ to 12 MHZ with JOHNSON the 90 PF Cap.

R2= 47 Ohm VHF parasitic oscilation stopper

R3= 100 Ohm VHF parasitic oscilation stopper

C6= 100/6V UF electrolytic cap. Its + end goes to the wiper on REGEN.

REGEN= 5K linear. Wiper goes to L2/C6. One end goes to GND. The

other end goes to D1/R7

D1= RED/GREEN LED. It regulates the DC voltage at about 1.8 volts

for Q1.

R7= 2.2K( 1K to 3.3K . All values in this range should work fine)

C2= 0.01 UF ceramic. This is RF filter cap. It bypassed RF around R1

while rolling off audio around 3 KHZ or so.

C3= 1 UF electrolytic.

R4= 560 K bias resistor. Connects between base and collector of Q2

R5= 4.7K( 3.9K to 6.8K. ) This should give around 2 Volts at the

collector of Q1 with a 6V supply.

C4= 0.02UF Audio rolloff capacitor.

R6= 470 OHM( 1K)

C7= 10 UF/6V electrolytic.

Q1= J305, MPF 102 etc

Q2= 2n2222a, 2n3904, BC107B/BC557B etc

additional notes:

1. BAD performance in regens is due to

a. overcoupling of antenna

b. excessive feedback coupling.(I think!)

c. too high a supply voltage. (1.0 to 1.5 is all that is needed)

d. Using high gain devices like bipolar transistors or dual gate

FETS etc. A low gain device like MPF 102 or J305 is all that

is needed

c. TOO much input signal overlaoading the regen detector.

2. The excessive hand capacity effects and instability can almost

be eliminated by the used of toroid to wind the coil L1/L2.

3. Also, you can fine tune the coverage by spreading or squeezing

the turns of the coild .

4 Once the coil has been tested to work fine, GLUE the coil L1/L2

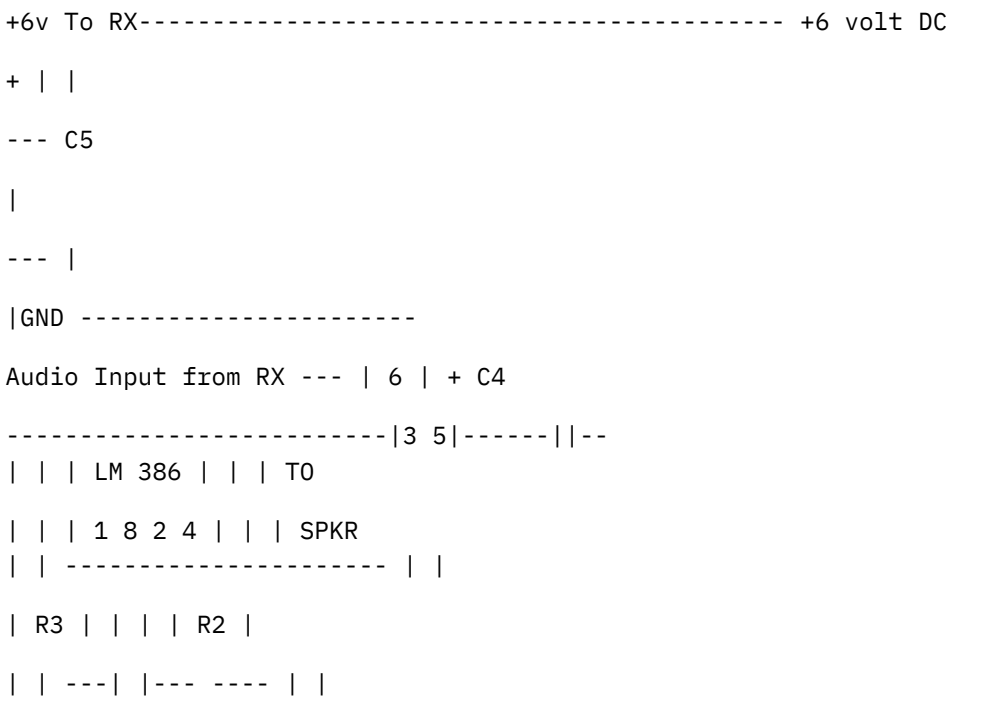
to the PCB with hot melt glue. This improves the stability of your

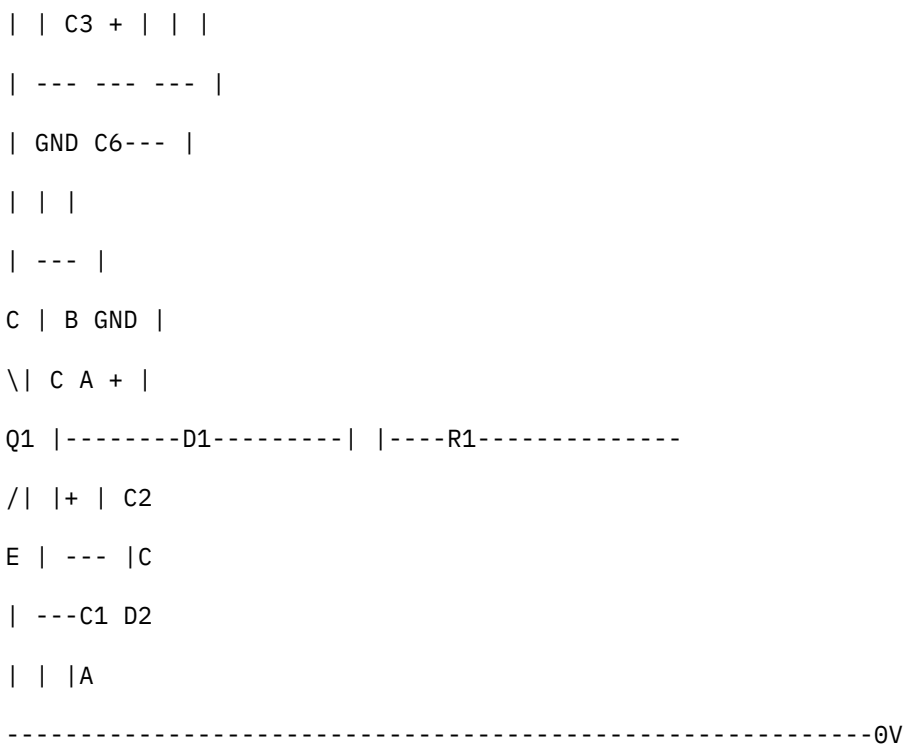
regen a lot.

5. KEEP the lead to gate of Q1 and L1/C1 as short as possible.

This is a high impedance node!

The LM386 audio amp with AGC is drawn as below:-





GND= common reference ground BUS

C1= 100UF / 16 V electrolytic

D1, D2= 1N4148

C2= 10UF / 16 V electrolytic

R1= 100 Ohm

C4, C5= 220UF/16V electrolytic

C3= 10UF/16V electrolytic

C6= 0.1 UF /50V ceramic

Q1= 2n3904, 2n2222A etc

R2= 10 Ohm

R3= 100 KOhm

note:

YES, you should be able to power the both from the same 6 volt supply

without oscilattions/motorboating.

Thanks to everyone for their help

happy home brewing

I believe the most popular series of scopes that Tek ever made was the
465, 475, 485 series, along with the later 465B. The 465s and 465Bs
are 100MHz, plentyful, becoming cheaper every day, and there should be
parts available, for those willing to scrounge, for decades.

I love my 465B.

>protect the broadcast radio's front end? Any thoughts?

>Thanks and 73...

>John, N3FPZ

Bingo, I think you just answered your own question. That's what a
duplexer is a notch filter. Do it if you want, but I like my
AM FM radio to much, I wouldn't try it.

Why not used an on the windshield antenna for the AM & FM.
Cut your old radio antenna down to a 1/4 wave (19 1/4").
But if it is mounted on the side of the car (like most)
it still won't work very well.

>are kept small.

This assumes that the crystal is cut for oven operation. The zero temperature coefficient can be zero for only a few degrees temperature range. Normal crystals are usually cut for zero temperature coefficient near 25 - 30 C, while oven crystals have their zero temperature coefficient placed near 60 C.

Operating a room temperature crystal at elevated temperatures in an oven will make it _more_ sensitive to temperature changes than operating it near room temperature, so the temperature control in the oven must be quite accurate.

>
>But why use a Peltier device? Why not just use a resistor as a heater,
>and control the temperature by feedback?

When using cheap room temperature crystals it is better to keep in constant temperature near room temperature for best stability.

If you are using battery power (at least for backup) it is nice if you do not have to use power all the time to keep the temperature constant. And even if a temperature correction is needed, it is usually only a degree or two if we talk about indoors operating, so the power requirement is not too great.

OTOH, you could build the oscillator inside a thermos, so the oven power consumption would be quite low.

Good point.

The problem with Peltier devices is that they are pretty efficient
heaters but lousy coolers. To move one watt of heat from their
"cool" side to their "hot" side, you need to supply 4 W of electrical
power, which is also dissipated on the "hot" side.

For example, to get 1 W of heating, you need to supply 0.8 W of electrical
power to the device, and the remaining 0.2 W will be picked up from the
cool side. But to get 1 W of cooling, you need to supply 4 W of electrical
power, and the hot side will dissipate 5 W total.

This means you need to have a lot of power available for the cooling
mode, and the servo system that drives the device should have about
5 times as much gain when cooling as when heating.

Note: the 4:1 power ratio is typical of Peltier devices being used
as refrigerators, with substantial temperature difference between
hot and cold sides. It might be much more efficient if the temperature
difference is smaller.

Look for datasheets at www.analog.com. But...I'm not sure what someone's been smoking there...the Analog Devices parts, at least, are not thermal converters, and they have a signal-level-dependent bandwidth that in the best case is in the 100's of KILOHertz, not MHz. On the other hand, the LT1088 is a thermal converter, and has a rated 3dB bandwidth of 300MHz, 2% accuracy to 100MHz. See www.linear.com for a datasheet. (It is, in fact, simply resistors thermally coupled to diodes that provide temperature sensing. You must provide the external amplifier circuitry. For each diode, there is both a 50 ohms and a 250 ohm resistor. The tolerance on the 50 ohm resistors is +/- 20%... The data sheet has quite a bit of applications info.)

I know that some RF power meters just use Schottky diode detectors...at low RF levels, they respond with a linear output voltage versus input power, or nearly so. I suppose you must feed them with a reasonably low distortion sinewave, but after all, that's most likely what you have anyway. Unfortunately, at levels around 0dBm, they've become rather non-linear (voltage out vs power in)...tending toward linear voltage out for voltage in. But if you use a precision attenuator in front of the detector, then you can have a single calibration point and use the attenuator to determine the input level. I've been using a zero-bias Schottky detector in an RF sniffer I use for fox hunting, and by feeding the output of the detector to a very-low-bias-current chopper-stabilized (1uV input offset) op amp (Harris), I can detect RF input voltages down to the 100uV region.

> -Ken
If the question is: Am I able to maintain a crystal temperature at or
near room temperature to a high degree of accuracy using a
thermoelectric device? Then, the answer is yes. Using a PWM controller
with a PID loop and an RTD sensor, you should be able to maintain
temperature to within 0.001 degrees (C or F, take you pick) if you make
the controller intelligent enough to recognize it is in a deadband
zone. Proportional Integrator/Differentiators are among the tightest
loops for controlling temperature. Resistance Temperature Devices are
among the most stable..although certain custom wire wound resistors can
maintain temperature stability for as long as they have been in use,
which is about 70 or 80 years. A PWM controller can be set up to
produce positive current when the duty cycle is more than 50% and
negative current when the duty cycle is less than 50%. Do you want to?
Only if building this thing is your hobby.
Ralph

## 2044. Cheap/decent 12V supply?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-21 00:00:00 UTC
From: jzawodny@pim.cse.nd.edu
Message-ID: <5ti5bd$1is@news.nd.edu>
Source record: 91658

Well the question this week goes as such. Computer power supplies
supply both 5V and 12V, and there are plenty laying around at work that
I could rig to produce the necessary current (and have backup) for
my VHF/UHF rig. Do you think that these supplies, powering a car battery
which provides that actual feed (and emergency backup power) to the
radio would be sufficient? Im trying to avoid spending the 130 dollars
I've seen radio power supplies going for...

Thanks

jtz

: find same?
: HP2835 diode

Dunno if this is a Hewlett-Packard diode...if it is, perhaps it's an
5082-2835. Other possibility would be a different prefix, like
HSMS-2835...

The 5082-2835 is a glass-packaged axial-lead diode, 8V min breakdown,
max 340mV forward at 1mA, 450mV at 10mA, 100nA at 1V reverse, 1.0pF
at 0V. Effective carrier lifetime max 100ps, measured at 20mA.

# 2047. A regen RX...:repost BMP

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-21 00:00:00 UTC
From: "P. Singh" <singhpk@NOSPAM.exit109.com>
Message-ID: <33FC8362.7E61@NOSPAM.exit109.com>
Source record: 91661

```
This is a multi-part message in MIME format.

--------------1EB13D525104
Content-Type: text/plain; charset=us-ascii
Content-Transfer-Encoding: 7bit

The regen Circuit and the audio amp ckt is reposted

below as requested .

Sorry for the (less than) clear ASCII schematic posted earlier.

------------------------------|

| |+ REGEN-----R7-----------R6-------+6VDC

| --- GND | | | |

L2 --- C6 -- |+ | | +

| |GND D1 | ---

| --- | R5 --- C5

| GND | | |

A-||---------R3---------- --- | ---

Ca | D | + To Input

G |--- |----+-----------| |----

------------R2-->| Q1 R4 |C | C7 of LM386

| | |--- S + | |/ | Audio Amp
| | |---------| |-----| Q2 |

| | | | C3 B |\E C4

L1 C1/TUNE R1 --- | |

| | | ---C2 | |

GND__|_______|_____________|____|______________|____|_____________ 0V

NOTES:

GND means Common (chasis ground BUS) reference point.

L1 = 40 Turns (AWG 26) on T-50-2 red ferrite toroid.

L2 = 3 (3-4) turns link on L1
```

The turns ratio between L1:L2 should be about 10:1

A= Antenna connection. Yes antenna is connected to

the drain of Q1. This gives excellent performance

even with a 10 FT antenna

(Connecting to gate of Q1 will overload the regen

and the performance will be very bad.)

Ca= 100 PF ceramic or so. Antenna coupling cap.

C1 = 90 PF johnson tuning cap with gearing and reduction.

try 40 PF - to 365 pF( the reciever works well with any

of these, though the coverage will be modified appropritely)

Coverage will be 5MHZ to 12 MHZ with JOHNSON the 90 PF Cap.

R2= 47 Ohm VHF parasitic oscilation stopper

R3= 100 Ohm VHF parasitic oscilation stopper

C6= 100/6V UF electrolytic cap. Its + end goes to the wiper on REGEN.

REGEN= 5K linear. Wiper goes to L2/C6. One end goes to GND. The

other end goes to D1/R7

D1= RED/GREEN LED. It regulates the DC voltage at about 1.8 volts

for Q1.

R7= 2.2K( 1K to 3.3K . All values in this range should work fine)

C2= 0.01 UF ceramic. This is RF filter cap. It bypassed RF around R1

while rolling off audio around 3 KHZ or so.

C3= 1 UF electrolytic.

R4= 560 K bias resistor. Connects between base and collector of Q2

R5= 4.7K( 3.9K to 6.8K. ) This should give around 2 Volts at the

collector of Q1 with a 6V supply.

C4= 0.02UF Audio rolloff capacitor.

R6= 470 OHM( 1K)

C7= 10 UF/6V electrolytic.

Q1= J305, MPF 102 etc

Q2= 2n2222a, 2n3904, BC107B/BC557B etc

additional notes:

1. BAD performance in regens is due to

a. overcoupling of antenna

b. excessive feedback coupling.(I think!)

c. too high a supply voltage. (1.0 to 1.5 is all that is needed)

d. Using high gain devices like bipolar transistors or dual gate

FETS etc. A low gain device like MPF 102 or J305 is all that

is needed

c. TOO much input signal overlaoading the regen detector.

2. The excessive hand capacity effects and instability can almost

be eliminated by the used of toroid to wind the coil L1/L2.

3. Also, you can fine tune the coverage by spreading or squeezing

the turns of the coild .

4 Once the coil has been tested to work fine, GLUE the coil L1/L2

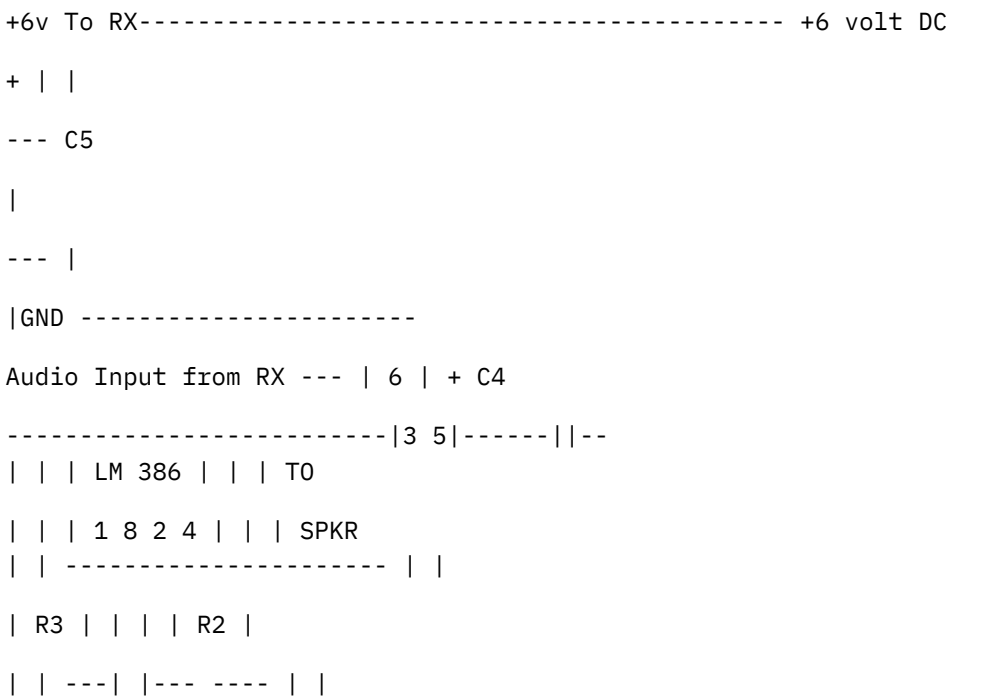
to the PCB with hot melt glue. This improves the stability of your

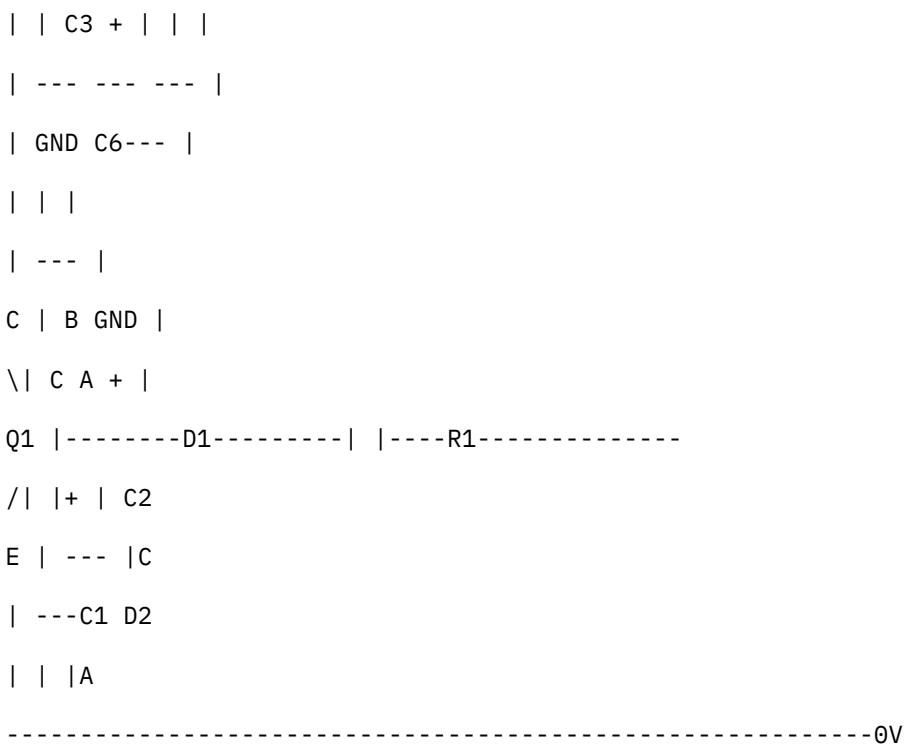
regen a lot.

5. KEEP the lead to gate of Q1 and L1/C1 as short as possible.

This is a high impedance node!

The LM386 audio amp with AGC is drawn as below:-





GND= common reference ground BUS

C1= 100UF / 16 V electrolytic

D1, D2= 1N4148

C2= 10UF / 16 V electrolytic

R1= 100 Ohm

C4, C5= 220UF/16V electrolytic

C3= 10UF/16V electrolytic

C6= 0.1 UF /50V ceramic

Q1= 2n3904, 2n2222A etc

R2= 10 Ohm

R3= 100 KOhm

note:

YES, you should be able to power the both from the same 6 volt supply

without oscilattions/motorboating.

happy home brewing

# 2048. WHAT'S DEFECT ON MY AUDIOSYSTEM

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-22 00:00:00 UTC
From: nautilus@worldaccess.nl
Message-ID: <5thu3c$el7@halley.pi.net>
Source record: 91518

My motorbike-radio (not available anymore) has the following defect:
1) By turning the radio on, the speakers sounds a loud 'plop'-sound
and
2) the volume doesn't sound so loud as it use to be.

Everything else is funcioning normal.

Who can tell me what part is defect, if I can repair it and what it
will cost me ?

The radio is good servicable (modulair) and about 12 years old.
I can't replace it because it also regulates my on board
intercom-system.

Thanks for your reply.

Bob

There are a lot of ways to control temparature of a crystal. If you are looking for somthing simple and easy try this. Enclose the crystal in a small container, an old metal cased octal tube is great for this. to 2 of the pins connect the crystal to 2 more of the pins connect a positive temp coefficent thermistor. the thermistor will heat to its Curie temp and stabilize there. it is self reguating. I had some thermistors that would do this a about 120F with about 12 volts applied.

> : there!)). I'll let you know what I find. Else if anyone has a
> MARCONI tft
> : PowerMeter head (working) going on the cheap I'd be interested. TIA

I have built one of these. It is an RF millivoltmeter, based around a
pair
of shottkey diodes. One is used for reference, the other has the signal
applied. Ideally they should be mounted so they are thermally coupled.

The diode voltages are differentially measured using an op-amp. With no
signal,
the difference is zero. Common mode signals (like temperature drift) are

rejected.

The beauty of this scheme is that you can calibrate it using DC and
measure
down to say -20dBm. Frequency response depends on construction. VHF
certainly, UHF is possible. Microwave - difficult.

If you want more sensitivity, you can bias the diodes in a perfect
recitifer
configuration. This will easily allow you to measure -50dBm in 50 ohms.
If you
want much less than this you need a preamp.

Don't put too much power in or the signal diode will warm up. Use
attenuators.

Source record: 91527

P. Singh wrote:

>
>
> Also Noise figure is not very important at HF.

Yes it is. Matching the noise figure to the band is very important
across the
spectrum. What would you make of a receiver with a noise figure of 100
dB? It
would be deaf even on 160m.

Noise figures of less than (say) 10 dB are unnecessary. If you have a 2
dB noise
figure on 80m and a good, large antenna, a 10 dB or even a 20 dB pad on
the input could improve the overall dynamic range.

There are other good reasons for using a pre-amp on HF - for example to
match
a short whip to the receiver. I use one on 73 kHz.

Don't hook any 12 volt power supply directly across a 12 volt battery.
When the battery charge is low the supply will send too much current to
the battery. You need to use a switching diode and a charging circuit to
limit current to the battery.

## 2059. RE: Room Temp "Oven" for Quartz?

PWM may not be the best thing to do. These coolers do not like the square waveforms. I think it causes physical stresses in the device as the unit turns on/off. You either need to integrate the PWM before going to your power amplifier or use some other method.

Computer power supplies are offline switchers that
produce too much RFI/EMI that could interfere
with the operation of (atleast) HF radio receivers.

Linear power supplies are much quiter.

Do you have web access? Analog Devices home page has a search engine at
the opening screen. I entered AD737 and got it. They're www.analog.com.

I've used the 737 in a signal measuring setup before, and it's a pretty
good chip. There are easier ways (i.e., more ham like). Pretty sure that
Solid State Design for the Radio Amateur covers these if you'd rather.
They involve using differential hot carrier diodes driving an op amp,
with perhaps some bias to get down to the -20 dBm level.

73,
Bob

300 or 400 V seem to be fairly common - you may be able to cascade several
to boost the voltage compliance range.

This approach is used in HV regulators (helium neon laser power supplies,
for example).

What are you trying to do?

Why do you require PNP types?

Overall, I agree with your comments. However, I feel that I should point out that successful SSB receivers have been built using direct conversion with the phasing method of detection. The old ARRL Single Sideband books carried a direct conversion phasing receiver with reasonable sideband supression and a while back QST carried a couple of articles on direct conversion receivers. The last article(s) dealt with direct conversion sideband reception using phasing techniques. This merely supports your statements that direct conversion techniques are indeed useful.

Either the phasing or "Weaver" techniques can be used to build a
simple "single signal" receiver and a SSB transmitter, too ... it is
possible to obtain substantial undesired sideband suppression without
too much difficulty ... especially with DSP techniques ...

DC has no skin effect, which is important even at 50 Hz for very large currents. DC has no radiation losses, which is also significant at 50 Hz over long distances. For a given RMS, DC has a 30% smaller peak current and peak voltage. DC has no capacitively coupled current loss (not the same as leakage current) therefore power factor loss, through the insulation into the salt water. This capacitive current can cause electrolysis effects.

>
> Comments here or remove the ! to reply via e-mail...73 all, Web Williams

Well, not quite! I have to argue against two of your points or
suggestions.
The cyanide is NOT just a cleaner. The silver ions bind to the
cyanide ions in a way leaving hardly any free silver ions in the plating
solution. (One book reports about 1 free silver ion per cubic
centimeter. That is a VERY small amount of silver. An ion is
esstentially just an atom.)
Why is that important? If there are many free ions and you stick
almost any metal into the solution the silver ions will pick up an
electron from the metal and become metallic silver while one of the
substrate ions will go into solution. This is the secret of

"electroless" plating. Sounds wonderful, but it is not; the metal deposited this way is poorly bonded and can be often wiped off with a rag. It is also porous. Metals going into solution include copper, zinc, iron, practically anything except gold and platinum!
The other objection is rubbing silver onto a hot surface. Actually, it probably could be made to work, if you are good and work fast. The problem is that the melting point of silver is lower than the melting point of copper (probably higher than for brass), but not a lot lower (a bit over 100 degrees C.) You are at risk of melting the copper if you heat with a tourch. It would work better with a silver bath (want to melt a liter of silver in the kitchen?) with good temperature control. There is another problem; the silver and copper rapidly alloy to form a lower melting point alloy. If you do not work fast this process can cause holes to develop as the alloy forms ever deeper into the substrate. This is something you will understand better if you ever did soldering on fine copper wire with lead-tin solder. The wire disappears if you are too slow. The silver/copper process will be faster. You will get a great bond, if you are good enough.

the ceramic resonnators are fine for oscillators, and they may be
pulled more than comparative xtals. I am sure you may use them for
filters, I have seen a BP-filter for 7MHz band using such devices

I posted some info on a newsgroup some times, but obviously this
attracted little interest or nobody makes any experiments any more?

I have made experiments with oscillators using ceramic resonators for
250, 480, 960kHz, and 3,58, 4.0 MHz
it is easy to pull a 3.58MHz element to cover 3.5-3,6MHz in a VFO
An oscillators using ceramic resonnators should have some 3 times
higher capacitor values than xtal oscillators to operate
satisfactorily

# 2078. measuring VVC-diodes, how?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-23 00:00:00 UTC
From: la8ak@online.no
Message-ID: <33ff3cba.2894767@news.online.no>
Source record: 91466

Hi
I need to calibrate capacitance diodes to voltage to use them in a
2-50MHz impedance meter. I believe it may not be a good idea to
measure the capacity using a C-meter, since signal voltage level may
be much higher than the actual dc voltage used.
I have a Radiometer Q-meter, but I would prefer an easier way than
measuring the influence on a tuned circuit.
Any better suggestions? What does manufacturers use?

altavoz:
Get off the idea that you must make the lower radiator match the upper exactly . It need not be a tube . It can be 4 wires , same len' as the upper radiator , angled down at a 15 deg angle and a small cap hat on the upper rad' . The pattern ends up the same !

_____thread below_____

I've just finished building a variation on this sleeve antenna which seems to work OK. I need to borrow a VHF SWR bridge and trim it yet, and then I can compare it to the J-Pole I've been using. My question is, should the two sides of the dipole be shorted together?

My antenna is constructed with 1/2 wavelength of copper 3/4" pipe over the feeding coax, with the braid shorted to the pipe at the midpoint of the antenna. The other half the dipole is base loaded to be electrically 3/4 wavelength long and physically 5/8 wavelength (I used a section of 1/8" steel rod with the coil making up the remainder of the length... I used a piece of solid phenolic plastic rod that plugs the end of the copper pipe and extends up as the coil form, and drilled out the center of the rod to set the steel element in). I am currently feeding the base of the loading coil with the coax center conductor, and do NOT have the two halves shorted... is this correct?

TIA,
Jason, N7IME

>= 10kW so about 5kW of RF ought to be possible... is this for a mobile
>demonstrator for St Elmo's fire ?
Hi David,
Thanks for your reply.
You taught me something new re welding generators!
With regards the regulator, I'd probably run with an external battery
sensing system.
On my 14v system I run an Adverc alternator controller which controls
the charging of the batteries to 100% instead of the normal 60-70% it
also takes into consideration any voltage drop across my 195A diode
splitter. I run with a seperate 240Ah deep cycle unit which looks after
the current amplifier.
St Elmo's fire I think not. Corona may of been fine in the good old days
of tube powered amps in the mobile but as it severely knocks the antenna
off tune, it could of course seriously damage ones amplifier so I just
run with a decent size corona ball.

(((73)))

Phil G4ZOW/M
All my amplifiers are of course only ever driven up to the UK legal
limit.

PS. You could probably run to 6-7KW PEP for short duration work and with a bank of batteries to help take the shock as a buffer as well as leaving long gaps between overs so as to let the alternator cool down.

It should work, in fact I've got one powering a Motorola commercial rig atop Tennessee's second tallest building right now. (for work..)

I'm not so sure you want to float the car battery directly across it. I'd use steering diodes, and if you run the car battery down, use a (car) battery charger to recharge it.

Do be aware that computer supplies require a MINIMUM load from the 5V supply. This could be a problem for your application since you aren't planning on using 5 volts for anything. (in my case, I also have 3 amps worth of industrial control boards) You might have to hang an obsolete hard drive or 8088 motherboard off a spare plug to get things to work. Of course, a resistor or light bulb will also work..

From: tait@primeline.net
Message-ID: <5tlsjr$bp2$3@nr1.toronto.istar.net>
Source record: 91549

I am looking for plans for a tv antenna rotator. It is one of the ones that the antenna mast goes through. It is a 4 wire, with the wires connected internally as follows:

1: Black, Motor common
2:Yellow , motor, switch NO
3:red , motor,switch NC
4:blue , switch common through 27 Ohm 5W Resistor.

The switch opens/closes about 30+ times per revolution of the mast.

I would like to build an electronic control box using discrete TTL chips if possible.

Im a bit late on the scene with this thread however:
If you have power available and dont mind the warm up time its easier to
make an oven than a TCXO. A peltier heater is unnecessary as the crystal
will hace a minimum temperature coefficient above 27C
Your crystal will be an AT (lazy Z) cut optimised for minimum deviation
over the whole band. If you temperature control just the crystal it
should be possible to raise the temperature by using a servo heater to
where the crystal reaches its minimum frequencey with luck and if the
crystal is correctly cut this will be about 35C.
The Maintaining circuit will still be sensitive to temperature and will
limit any crystal only control to +-0.5ppm or so.

> receivers.

you are right.

Can I ask how RFI does a ordinary superhet radiate? After all, the
superhet has 1-5 oscilators going.

HOW much RFI does a typical computer radiate? It radiates enough
RFI to generate S-9 noise on all HF bands.

HOW much RFI does a TV set radiate? Enough to blank out the LF bands
below 500 KHZ.

So, RFI generated by a regen receiver is like the least of the
problems today.

YES, the RFI radited by regen RX can be reduced by proper design.
1. Operate the regen at very low poer levels( microwatts)
2. Use a loosely coupled antenna.

The use of RF amp to isolate the regen from the antenna is not
recommended because:-
1. It worsens the overload and cross-modulation problem.
2. Does not provide a lot more isolation than a loosely couple antenna
can provide.
3. RF amp degrades the noise performance of the regen RX.
My regen is a lot more sensitive than my superhet RX SONY
ICF 2001. In fact I use the regen as a regenerative antenna
amplifier/ Q multiplier at the signal frequency for the SUPERHET.

> Then we go to DC receivers (page 12-8). I quote "direct conversion

> phasing networks for single signal reception are probably valid,

COLLINS now a part of ROCKWELL(military contractor) has a DC
reciever using DSP techniques as its top product. This DSP/DC
reciever can recieve AM,FSK among all the usual SSB, CW etc.
I believe if collins thinks that the DC/DSP reciever is the way
to GO for military technology, that really may be the way to
go for the future.

I still have to get my R2 reciever running.
I guess I will. someday.

They problem, as far as I am concerned with DC recievers, is the
90 degrees phase shifted I-Q VFO signals needed.

I think that a R2 driven by a DDS VFO may be the best bet.

May be ,all the I-Q filtering/signal done in OPAMPS in the R2
should probably be done by a motorola DSP 56000.
(Does any one know where to buy a motorola DSP 56000 devlopment kit?)

>I'm not
> sure if all designers/experimenters agree, and, besides the purpose of
> the Handbook should be to stimulate experimentation, and not discourage
> the use of certain techniques.
> Though most comments in the book are accurate (and helpful), I

YES, It is not just the negative tone, it is the very casual and
less than a good engineering approach of the handbook which does
more harm than good.
Advances in radio engineering are still possible and happening
today. But they are more or less happening in the corporations etc.

( All the information about (ROCKWELL COLLINS) was taken from their
web-page as I remember it. So, look at their web page for more
information)

# 2092. VCO , paralleling Varactors

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-23 00:00:00 UTC
From: "P. Singh" <singhpk@NOSPAM.exit109.com>
Message-ID: <33FEBCB1.FF5@NOSPAM.exit109.com>
Source record: 91552

Does anybody know why paralelling another varactor across
the varactor of a LC Voltage controlled oscilator not increase
the tuning range of the VCO?

Both the varactors are reverse biased by the tuning voltage,
as varactors should be. So, connecting another varactor
across the LC tank circuit of a VCO should increase the freq
range of the VCO by 50% or so. It only does so by 1-5%. WHY?

They AC voltage across the tank circuit is going to be about 10 volts
or so. The DC bias voltage for the varactor is about 1-10 volts or so.
So, is it that the varactor is working in a totally nonlinear way?

Will connecting two varactors back-to-back and then paralelling
work. Or they still might be operating in a non linear way?

Does any body have any experience with paralelling single varactors
across the LC tank circuit of VCO.

ANy insight / help is greatly appreciated.

Thanks

MAYBE. Each device (tube, FET, MOSFET, BJT) has a diffrent set of
parameters. Even each type of tube(6J6, 6AK5, 6DJ8) differs as
to G-P, G-C, C-P capacitances, and their transconductance.

I guess the key is to design around the limitations of the device
that we are using.

These limitations are not very difficult to design around for FETs.
MPF102 is not a very good FET for RF usage. Though it
is still usable.
You can use a dual gate MOSFET like 40673 3SK174 etc,
but their is not likely to be a lot of difference between that
and a properly designed circuit using J-310.
( J-310 is a good device for general RF usage, much better than
MPF-102).

I guess the key is balance.

1.Just enough RF gain to give you a good noise figure with the antenna
and frequency you intend to use it with. Too much gain and you may
compromise the cross modulation performance. If your front end(mixer)
is sensitive enough, you might not need any RF gain atall.

2. Impedance matching. This cannot be stressed enough.
In fact they say that the key to SUCCESSFUL RF design is
impedance matching!
1.Match antenna impedance to input tuned circuit. If you have a
large antenna, use a 1 turn link to couple the antenna.
If all you have is a 6 feet whip as an antenna, connect it to the
top or the hot end of the antenna.
2. Match source impedance to input tank. Generally 2 turns should
be all that is needed.
3. Match drain impedance to output tank. Around 50% or should be good.

3. Adjust input and output loading.More loading means less circuit Q
whcih might help in adjusting BAND coverage and tracking between
input and output circuits.
Less loading will make tuning much more sharp and increase
circuit Q.
4. Having adjusted loading , you might want to go to Step 2 to fine
tune the impedance matching, though it should not be really
neccessary.

5. If you still have problems with crossmodulation, run the FET
as HOT as possible, i.e. with as much drain current as possible.
I guess around 20 mA or so.
It was stated somewhere that even a BJT can have very good
crossmodulation performance better than a dual gate MOSFET
by running it at about 20-50 mA or so.
Device linearity is greatly increased and crossmodulation reduced
by running the device hot enough.

6. Use of pads can improve cross modulation performace.
This is suggested if you have a large antenna.

7. Also, it might be good idea to bear in mind that the
Cross MOD performace of the mixer should be high enough
for you to use a RF pre amp.
DONT even think about using an preamp with a NE602 mizer front end
or general coverage portable SW radios receievers. Just use
a passive 1-2 tuned circuit filters . A lot of performance gain
can be acheived just by proper impedance matching and NO FET
rf amp.
Please think about the NO FET(or tube or transistor) RF amp also!
It produces RF gain by proper impedance matching.

kind
>>of equipment is used to transform from AC to DC and DC to AC?
>>Could it be power factor?
>>73 and TIA
>
>The main reason is that DC is subject to only the resistance losses in
the conductors. The line inductance and capacitance does not cause
reactive voltage drop is a DC transmission line. In an AC line these
losses are serious and must be corrected wth very expensive capacitor
banks.

The reason that DC is not often used is that the cost of the high
voltage solid state conversion systems have been very expensive in the
past. Recently these cost have dropped and more DC transmission lines
are being considered and will be built.

The merits of DC vs AC power generation,transmission, and distribution
were highly debated at the turn of the century by Edison (DC) and Tesla
(AC). Tesla eventually won the debate, but with the changes in
technology of the next century, Edison and DC may be exonerated.

solution
>you have to first develop a hell of a lot of prints or film. OK?

The silver is all removed when the film is "fixed". The sodium
thiosulfate fixer after it has been used, contains the silver, not the
developer.

My experience is silver plating is that using spent fixer doesn't work
well. The only method I have found , that works is to use a sodium
cyanide process. This involves disolving silver in nitric acid to adding
salt to generate a cheap silver halide salt and then disolving it in
water with the cyanide. The plating is done electrolytically.

I did it once and don't recommend it. The silver plating was beautiful
BUT... The cyanide gas can easily kill you.

Hi Dave

I've done quite a bit of work with SM packages in my microwave work. There is no real problems, any more than with other type, the R's and C's take a bit of geting used to (they fly round the shack really well if you get the mounting wrong!), but it just requires new skills to be learnt, but certainly not difficult or impossible for Mr Average Ham.

These cheap switching power supplies are terrible choices for radio use,
far too noisy. Best is battery ONLY...a decent 12V Lead Acid car battery
used AS-IS (sans charger) then when you switch OFF your set up...you
turn ON the charger.
Simple, Cheap, loads of current and, best of all, quiet.

# 2100. Re: VCO , paralleling Varactors

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-23 00:00:00 UTC
From: "John M. Franke" <j.m.franke@larc.nasa.gov>
Message-ID: <33FF17E3.3620@larc.nasa.gov>
Source record: 91560

What is important is the maximum to minimum capacitance ratio of the varactor. If the maximum capacitance is 100 pF and the minimum is 10 pF, the ratio is of course 100/10 = 10. Paralleling two varactors produces a new ratio of 200/20 = 10, no change. Since the resonant frequency is equal to 1 divided by 2 pi times the square root of L times C, the change in frequency is proportional to 1 over the square root of the change in the LC product. In this case the frequency range is the square root of 10. One way to help see this is to insert values into the equation and see what happens. Pick an inductor, calculate the minimum and maximum frequency for the minimum and maximum capacitance with one varactor. Then repeat for two.
Does this help?
John

# 2101. Re: power transmission (electric)

Well, really it was George Westinghouse who fronted the bills for
Edison's "AC is to dangerous to use" campaign. Edison fought as dirty
as he could. He arranged for NY state to receive a Westinghouse
Alternator which was used the first electrocution, a rather botched
affair. Edison had gone around NY state county fairs showing AC was
lethal by dispatching farm animals with an alternator. The critical
event that decided the issue was the award of the power plant at
Niagara Falls to the AC system. The issue turned on distribution and
AC clearly had the advantage there. I believe--but am not sure--that
a 25 Hz system is still in use at the falls.

I have what I have been told is an Alliance U-100 Rotator, I need a control box for, but don't wish to shell out the bucks for one.

Does anybody have plans for a solid state box, I could build out of TTL or cmos gates (other than the motor control circuitry of course.)

Dow key relays can be used for much more than switching from transmit to receive in boatanchors. Some uses are:

switching between 2 antennas
switching in/out a preamplifier at the antenna
switching transverters to a common IF
switching rigs to a SWR meter

and many more.

From: "Jeff W. Hockert" <hockerj@ece.orst.edu>
Subject: 2 meter antenna

I've just finished building a variation on this sleeve antenna which seems
to work OK. I need to borrow a VHF SWR bridge and trim it yet, and then I
can compare it to the J-Pole I've been using. My question is, should the
two sides of the dipole be shorted together?

My antenna is constructed with 1/2 wavelength of copper 3/4" pipe over the
feeding coax, with the braid shorted to the pipe at the midpoint of the
antenna. The other half the dipole is base loaded to be electrically 3/4
wavelength long and physically 5/8 wavelength (I used a section of 1/8"
steel rod with the coil making up the remainder of the length... I used a
piece of solid phenolic plastic rod that plugs the end of the copper pipe
and extends up as the coil form, and drilled out the center of the rod to
set the steel element in). I am currently feeding the base of the loading
coil with the coax center conductor, and do NOT have the two halves
shorted... is this correct?

TIA,
Jason, N7IME

Hi Dave

I've done quite a bit of work with SM packages in my microwave work.
There is no real problems, any more than with other type, the R's and
C's take a bit of geting used to (they fly round the shack really well
if you get the mounting wrong!), but it just requires new skills to be
learnt, but certainly not difficult or impossible for Mr Average Ham.

On a tangential issue, has anyone done much hobby work with the new
SOT gull-wing or even surface mount packages? The "pin" spacing on
some of these is getting awfully small. I've gotten a few samples of
some nice IC's I's like to evaluate, but etching and soldering at
those line widths makes me wonder if at some point the amateur
homebrewer is going to get scraped off.

> this (Too much gain? Why would the lead length matter?)

The lead length doesn't matter so much as the circuit's design. The
problem with that circuit is that it's inherently unstable when its input
and output are tuned. (Grounding a JFET's gate doesn't shield O from I as
grounding a vacuum tube's grid can do.) The MPF102 isn't a very gainy
JFET, so if you tap the I/O tuned circuits down far enough and/or stagger
the I/O circuits' tuning, *and* there's sufficient loading at I and/or O,
the circuit may not oscillate.

That circuit also disserves you by getting much less selectivity out of two
tuned circuits than can easily be achieved with them.

A better approach is to close that book and use a circuit engineered for
predictable gain and stability. One recommendation is the single-40673
amplifier described by Wes Hayward, W7ZOI, in November 1981 *QST*'s
"Progressive Communications Receiver," later carried in many subsequent
ARRL *Handbook*s under the title "High-Performance Communications Receiver"
(it's in the 1992 edition, for instance). (Yes, 40673s are now "new old
stock," but you can also use an ECG222, NTE222, MPF131, 3N187 and 3SK
[Japanese] or BF [European] equivalents. Dual-gate MOSFETs may be passe
over in the US, but in Japan and Europe they're still very much viable.
The Japanese in particular have taken receive-class JFETs and MOSFETs much
further than manufacturers here; even the [old] 2SK125, for instance, is
much better than the best [J310/U310] generally available here.)

When you combine Hayward's amplifier with the appropriate
double-tuned-circuit output filter (described in the same article that
describes the amplifier), you'll have good, predictable gain (10 dB) *and*
the selectivity you need. Wes's circuit isn't the only possible solution
to your problem, of course, but it has withstood the tests of time and use

that the other circuit hasn't.

David Newkirk, W9VES

MAYBE. Each device (tube, FET, MOSFET, BJT) has a diffrent set of
parameters. Even each type of tube(6J6, 6AK5, 6DJ8) differs as

to G-P, G-C, C-P capacitances, and their transconductance.

I guess the key is to design around the limitations of the device
that we are using.

These limitations are not very difficult to design around for FETs.
MPF102 is not a very good FET for RF usage. Though it
is still usable.
You can use a dual gate MOSFET like 40673 3SK174 etc,
but their is not likely to be a lot of difference between that
and a properly designed circuit using J-310.
( J-310 is a good device for general RF usage, much better than
MPF-102).

I guess the key is balance.

1.Just enough RF gain to give you a good noise figure with the antenna
and frequency you intend to use it with. Too much gain and you may
compromise the cross modulation performance. If your front end(mixer)
is sensitive enough, you might not need any RF gain atall.

2. Impedance matching. This cannot be stressed enough.
In fact they say that the key to SUCCESSFUL RF design is
impedance matching!
1.Match antenna impedance to input tuned circuit. If you have a
large antenna, use a 1 turn link to couple the antenna.
If all you have is a 6 feet whip as an antenna, connect it to the
top or the hot end of the antenna.
2. Match source impedance to input tank. Generally 2 turns should
be all that is needed.
3. Match drain impedance to output tank. Around 50% or should be good.

3. Adjust input and output loading.More loading means less circuit Q
whcih might help in adjusting BAND coverage and tracking between
input and output circuits.
Less loading will make tuning much more sharp and increase
circuit Q.
4. Having adjusted loading , you might want to go to Step 2 to fine
tune the impedance matching, though it should not be really
neccessary.

5. If you still have problems with crossmodulation, run the FET
as HOT as possible, i.e. with as much drain current as possible.
I guess around 20 mA or so.
It was stated somewhere that even a BJT can have very good
crossmodulation performance better than a dual gate MOSFET
by running it at about 20-50 mA or so.
Device linearity is greatly increased and crossmodulation reduced
by running the device hot enough.

6. Use of pads can improve cross modulation performace.
This is suggested if you have a large antenna.

7. Also, it might be good idea to bear in mind that the
Cross MOD performace of the mixer should be high enough
for you to use a RF pre amp.
DONT even think about using an preamp with a NE602 mizer front end
or general coverage portable SW radios receievers. Just use
a passive 1-2 tuned circuit filters . A lot of performance gain
can be acheived just by proper impedance matching and NO FET
rf amp.
Please think about the NO FET(or tube or transistor) RF amp also!
It produces RF gain by proper impedance matching.

From: la8ak@online.no (J M Noeding)
Subject: measuring VVC-diodes, how?

Hi
I need to calibrate capacitance diodes to voltage to use them in a
2-50MHz impedance meter. I believe it may not be a good idea to
measure the capacity using a C-meter, since signal voltage level may
be much higher than the actual dc voltage used.
I have a Radiometer Q-meter, but I would prefer an easier way than
measuring the influence on a tuned circuit.
Any better suggestions? What does manufacturers use?

Not much, if there are a lots of different pagers in different
frequencies.

A good choice might be a sharp bandpass filter--the bigger the
better. One the size of a loaf of bread might do the trick, though

people have made them out of 20 gallon garbage cans... Zack W1VT

Frank, tell us a bit about what you're trying to accomplish, maybe we can
suggest alternate approaches using more common parts.

>>Why do power companies use DC to transmitt power. 400KV, 500MW. What
kind
>>of equipment is used to transform from AC to DC and DC to AC?
>>Could it be power factor?
>>73 and TIA
>
>The main reason is that DC is subject to only the resistance losses in
the conductors. The line inductance and capacitance does not cause
reactive voltage drop is a DC transmission line. In an AC line these
losses are serious and must be corrected wth very expensive capacitor
banks.

The reason that DC is not often used is that the cost of the high
voltage solid state conversion systems have been very expensive in the
past. Recently these cost have dropped and more DC transmission lines
are being considered and will be built.

The merits of DC vs AC power generation,transmission, and distribution
were highly debated at the turn of the century by Edison (DC) and Tesla
(AC). Tesla eventually won the debate, but with the changes in
technology of the next century, Edison and DC may be exonerated.

Either the phasing or "Weaver" techniques can be used to build a
simple "single signal" receiver and a SSB transmitter, too ... it is
possible to obtain substantial undesired sideband suppression without
too much difficulty ... especially with DSP techniques ...

# 2108. Heathkit "Seneca" Model VHF-1..Help

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-24 00:00:00 UTC
From: gwilljo@cwo.com
Message-ID: <5tocrk$hub$1@bigdog.eli.net>
Source record: 91478
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.ham.swap,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I have a SENECA VHF-1. When you turn it on, the relays click and the
in-line fuses blow. I've checked the caps and power transformer.
There is a 1N1239 can type diode (?) stuck in the socket that th 5R4
(v8) goes into. Any ideas? THis rig has had extensive modifications made
to it... all annotated in the schematic and manual, but I swear....

Greg
KB6WKW

PS I'm not a Tech yet. I just like diddling with the circuits...
Any ideas?

## 2109. Relay needed

>way. Also, Q is rather low for these types of varactors.

Sounds like the conditions are similar to the parametric amplifier or varactor tripler :-).

If the high RF voltage across the varactor is your problem, then why not use a varactor with large maximum capacitance (a tuning range from ,say, 25 pF to 250 pF) in series with a small (say 100 pF) fixed capacitor. The two capacitances will form a capacitive voltage divider, at the minimum capacitance the AC voltage across the varactor is only slightly reduced but at maximum capacitance only a very small fraction of the RF voltage is across the varactor (2/7 in this case). This greatly reduces the risk for forward biasing at low tuning voltages.

Your problem seem to be the large parallel capacitance, so it is quite unrealistic to expect to get any large tuning range with varactors with low maximum capacitance. With values in my example, you would get sqrt ( (100+71)pF/(100+20)pF ) = 1.19 or 19 %. Using a larger series capacitance would make the tuning range even larger, but it would also increase the RF voltage across the varactor.

Hi

THis was done succesfully in the Uniden President Jackson CB
radio.Looking at the schematic there are actually two pair of varactors
in addition to the main varactor used in the VCO circuit to extend the range.

The aux pairs are switched in by the channel selector at
a specific programming word.

Hope this helps...

I have 4 each, new Dow-Keys with N connectors, the Rx isolation button, and DPDT external contacts. They have 12 volt DC coils (which are replaceable if you don't like 12 VDC) Bought 15 years ago when I was into moonbounce. They handle KW at 432 MHz, although I don't think they are rated for it.

$50 each

it is fairly easy to go much further down than this!
With 2x 1N270, or better AA119 type germanium diodes and CA3140E
OP-amp you can measure down below -46dBm up to at least 600MHz.

I made a correction amplifier using several 1N4148 for each range, but
today, I would have tried a CA3140E buffer, with a possible log.amp
and connect this to a datalogger, which may be calibrated for every
10dB range, with some possible frequency calibration (like the one you
have on SHF power meters). With this circuit you might measure below
-40dBm on 1,296GHz, and still have useful sensitivity above 2.320 GHz.
But you have to calibrate the circuit yourself. This is accomplished
by borrowing a signal generator from work or from a friend (most SHF
friends have some sort of reliable signal generators)

From: tait@primeline.net (Gary Tait)
Subject: Antenna rotator control box schematic needed.

I am looking for plans for a tv antenna rotator. It is one of the ones that
the antenna mast goes through. It is a 4 wire, with the wires connected

internally as follows:

1: Black, Motor common
2:Yellow , motor, switch NO
3:red , motor,switch NC
4:blue , switch common through 27 Ohm 5W Resistor.

The switch opens/closes about 30+ times per revolution of the mast.

I would like to build an electronic control box using discrete TTL chips if possible.

the ceramic resonnators are fine for oscillators, and they may be
pulled more than comparative xtals. I am sure you may use them for
filters, I have seen a BP-filter for 7MHz band using such devices

I posted some info on a newsgroup some times, but obviously this
attracted little interest or nobody makes any experiments any more?
I have made experiments with oscillators using ceramic resonators for
250, 480, 960kHz, and 3,58, 4.0 MHz
it is easy to pull a 3.58MHz element to cover 3.5-3,6MHz in a VFO
An oscillators using ceramic resonnators should have some 3 times
higher capacitor values than xtal oscillators to operate
satisfactorily

From: k3ky@juno.COM (David E Sinclair)
Subject: Cheap/decent 12V supply?

Using the 12V supply only from a 5V/12V computer supply probably would
not
work well for charging a 12V lead/acid car battery. More voltage is
needed. If
the two supplies in the computer unit are not ground referenced, then
they
could be series-connected for 17V. Some simple circuitry could be used to
control or limit the battery charge current. There are several approaches
such as constant voltage, constant current, taper charging, etc. I will

be glad
to supply references/schematics, etc. on request. Some other writers have
pointed out correctly that a linear supply would be a better choice than
a
noisy computer switching supply, and that one or both supplies in the
switch-
ing unit may have a minimum current requirement. That can be easily met
with
various types of loads added in parallel with the supply needing it.

For RF prototyping where I used to work, they used little single-sided
PCBs about 1" square, with adhesive backing, with a surface mount
pattern for a single chip brought out to wider pads. These were
positioned on the Cu side of a piece of PCB laminate and the circuit
wired up directly on the Cu ground plane with wire-wrap wire or self-
fluxing magnet wire. I'll ask someone there where they got the things
from. They were very cheaply made, and were free issue in the lab. I
should have liberated a few before I left. 8-(

DC has no skin effect, which is important even at 50 Hz for very large currents. DC has no radiation losses, which is also significant at 50 Hz over long distances. For a given RMS, DC has a 30% smaller peak current and peak voltage. DC has no capacitively coupled current loss (not the same as leakage current) therefore power factor loss, through the insulation into the salt water. This capacitive current can cause electrolysis effects.

Subject: power transmission (electric)

Hi,
I've been an engineer (manager) in the undersea cable business for 30 years and know of only a few DC cable projects for very specific applications. DC would not be an effective way to transmit power. High voltage pluse cables for digital transmission (very low current) are the only cables I know fit your discription. These are not power cables. Undersea power transmission are larger cables and are usually 5,15,35,64,130kv cables having conductors with thousands of circular mils and range from 4" to 8" diameters. There are some even larger. Cables usually contain 3 or 4 main conductors and are operated in a three phase (balanced) configuration. Today, many undersea power cables contain optical light guides (fiber optics) for signal transmission. Corona is normally controlled by proper shielding and the use of semi-con materials. External damage is the major cable failure although the we still like to get excited over the effects of "treeing" (crack propagation within a dielectric due to electro stress). If you would like any more details on cable or cable useage, drop me an email. Oxford,William & Associates: Cable Systems Consultants. wjoxford@aol.com or N4MXF@aol.com. 73 Bill

Well, not quite! I have to argue against two of your points or
suggestions.
The cyanide is NOT just a cleaner. The silver ions bind to the
cyanide ions in a way leaving hardly any free silver ions in the plating
solution. (One book reports about 1 free silver ion per cubic
centimeter. That is a VERY small amount of silver. An ion is
esstentially just an atom.)
Why is that important? If there are many free ions and you stick
almost any metal into the solution the silver ions will pick up an
electron from the metal and become metallic silver while one of the
substrate ions will go into solution. This is the secret of
"electroless" plating. Sounds wonderful, but it is not; the metal
deposited this way is poorly bonded and can be often wiped off with a
rag. It is also porous. Metals going into solution include copper,
zinc, iron, practically anything except gold and platinum!
The other objection is rubbing silver onto a hot surface. Actually,
it probably could be made to work, if you are good and work fast. The
problem is that the melting point of silver is lower than the melting
point of copper (probably higher than for brass), but not a lot lower (a
bit over 100 degrees C.) You are at risk of melting the copper if you
heat with a tourch. It would work better with a silver bath (want to
melt a liter of silver in the kitchen?) with good temperature control.
There is another problem; the silver and copper rapidly alloy to form
a lower melting point alloy. If you do not work fast this process can
cause holes to develop as the alloy forms ever deeper into the
substrate. This is something you will understand better if you ever did
soldering on fine copper wire with lead-tin solder. The wire disappears
if you are too slow. The silver/copper process will be faster. You will
get a great bond, if you are good enough.

From: "P. Singh" <singhpk@NOSPAM.exit109.com>
Subject: VCO, paralelling varactors

FRANK,

I guess I was not as clear as I should have been.

1 varactor VCO ( MV109)
case 1: CFIXED = 100 PF
CVARACTOR= 2-20PF
CTOTAL= 102-120 PF
Cmax/cmin= 1.176
FreqMax/FreqMin= SQRT(1.176)= 1.085 or 8.5%

2 paralell Varactor VCO( 2*MV 109)
case 2: CFIXED = 100 PF
CVARACTOR= 4-40PF : 2 varactors in parallel
CTOTAL= 104 to 140 PF

Cmax/Cmin= 140/104= 1.346
FreqMax/FreqMin= SQRT(1.346)= 1.16= 16%

Thus the max to min capacity should change.

But I could not detect the change in frequency coverage
after adding the second varactor.
(Maybe I made an error in my experiment.)

I guess that my question was, is the maximum capacity really
going to double when you paralell another varactor across the
varactor of a VCO. I am specificall talking about (1 varactor
VCO) and NOT the 2 back-to-back varactor VCO.

I dont really know, but, I think that the one varactor VCO
drives the varactors in a highly non-linear way.There will be 5-10
volts RF/AC across the varactor, and 1-10 volts DC to tune it.
Thus, I believe that varactor will be working in a highly nonlinear
way. Also, Q is rather low for these types of varactors.

Anyway, I try this varactor paralleling again, and hopefully I had
done something wrong earlier, and paralelling varactors really
does increase their max capacity in case of a VCO.

Thanks for your thoughts.

Sounds like the conditions are similar to the parametric amplifier or varactor tripler :-).

If the high RF voltage across the varactor is your problem, then why not use a varactor with large maximum capacitance (a tuning range from ,say, 25 pF to 250 pF) in series with a small (say 100 pF) fixed capacitor. The two capacitances will form a capacitive voltage divider, at the minimum capacitance the AC voltage across the varactor is only slightly reduced but at maximum capacitance only a very small fraction of the RF voltage is across the varactor (2/7 in this case). This greatly reduces the risk for forward biasing at low tuning voltages.

Your problem seem to be the large parallel capacitance, so it is quite unrealistic to expect to get any large tuning range with varactors with low maximum capacitance. With values in my example, you would get sqrt ( (100+71)pF/(100+20)pF ) = 1.19 or 19 %. Using a larger series capacitance would make the tuning range even larger, but it would also increase the RF voltage across the varactor.

From: "P. Singh" <singhpk@NOSPAM.exit109.com>
Subject: VCO , paralleling Varactors

Does anybody know why paralelling another varactor across
the varactor of a LC Voltage controlled oscilator not increase
the tuning range of the VCO?

Both the varactors are reverse biased by the tuning voltage,
as varactors should be. So, connecting another varactor
across the LC tank circuit of a VCO should increase the freq
range of the VCO by 50% or so. It only does so by 1-5%. WHY?

They AC voltage across the tank circuit is going to be about 10 volts
or so. The DC bias voltage for the varactor is about 1-10 volts or so.
So, is it that the varactor is working in a totally nonlinear way?

Will connecting two varactors back-to-back and then paralelling
work. Or they still might be operating in a non linear way?

Does any body have any experience with paralelling single varactors
across the LC tank circuit of VCO.

ANy insight / help is greatly appreciated.

Thanks

> (snip)

Maybe you should have a look at a more recent issue? My latest
copy (1996) discusses regens as primarily a historical thing, but
considers direct conversion receivers to be an effective way of
receiving signals.

I can think of a number of important designs between 1988 and 1996
that would have changed the perception of DC receivers as cute toys,
but not serious receivers...

As always, you get what you pay for. An extremely simple receiver
will get the job done under some circumstances, but may not
hold up under extreme conditions.

>VCO) and NOT the 2 back-to-back varactor VCO.
<snip>

Perhaps the problem with paralleling two varactors is that the two diodes is not matched, resulting in more current flowing in one of the diodes.
Try using two resistors (and RFCs), to separate the bias voltages, and use two (relatively) large capacitors in series with the HF path. I'm too lazy to try to draw it in ascii, but I hope you get the idea.

I haven't actually tested this, it is just a guess.

Please post your results, if you try it out.

Subject: 11volts from 12 volts...

Hi bill,

Almost every 12 volt supply I have built using a 3 terminal
fixed regulator puts out about 11.5 volts or so. It seems
that the 12 volt regulators are manufactured with WIDE
tolerances.

Just use a diode or two in the ground lead of your 3 terminal reg
to increase output 11 volts to 12 volts or so.

D1, D2= In4001
C1= 10uf/16volts electrolytic

Subject: Cheap/decent 12V supply?

These cheap switching power supplies are terrible choices for radio use,
far too noisy. Best is battery ONLY...a decent 12V Lead Acid car battery
used AS-IS (sans charger) then when you switch OFF your set up...you
turn ON the charger.
Simple, Cheap, loads of current and, best of all, quiet.
friend,
Lute

it is fairly easy to go much further down than this!
With 2x 1N270, or better AA119 type germanium diodes and CA3140E
OP-amp you can measure down below -46dBm up to at least 600MHz.

I made a correction amplifier using several 1N4148 for each range, but
today, I would have tried a CA3140E buffer, with a possible log.amp
and connect this to a datalogger, which may be calibrated for every
10dB range, with some possible frequency calibration (like the one you
have on SHF power meters). With this circuit you might measure below
-40dBm on 1,296GHz, and still have useful sensitivity above 2.320 GHz.
But you have to calibrate the circuit yourself. This is accomplished
by borrowing a signal generator from work or from a friend (most SHF
friends have some sort of reliable signal generators)

From: tait@primeline.net (Gary Tait)
Subject: Antenna rotator control box schematic needed.

I am looking for plans for a tv antenna rotator. It is one of the ones that
the antenna mast goes through. It is a 4 wire, with the wires connected
internally as follows:

1: Black, Motor common
2:Yellow , motor, switch NO
3:red , motor,switch NC
4:blue , switch common through 27 Ohm 5W Resistor.

The switch opens/closes about 30+ times per revolution of the mast.

I would like to build an electronic control box using discrete TTL chips if
possible.

the ceramic resonnators are fine for oscillators, and they may be
pulled more than comparative xtals. I am sure you may use them for
filters, I have seen a BP-filter for 7MHz band using such devices

I posted some info on a newsgroup some times, but obviously this
attracted little interest or nobody makes any experiments any more?
I have made experiments with oscillators using ceramic resonators for

250, 480, 960kHz, and 3,58, 4.0 MHz
it is easy to pull a 3.58MHz element to cover 3.5-3,6MHz in a VFO
An oscillators using ceramic resonnators should have some 3 times
higher capacitor values than xtal oscillators to operate
satisfactorily

From: k3ky@juno.COM (David E Sinclair)
Subject: Cheap/decent 12V supply?

Using the 12V supply only from a 5V/12V computer supply probably would
not
work well for charging a 12V lead/acid car battery. More voltage is
needed. If
the two supplies in the computer unit are not ground referenced, then
they
could be series-connected for 17V. Some simple circuitry could be used to
control or limit the battery charge current. There are several approaches
such as constant voltage, constant current, taper charging, etc. I will
be glad
to supply references/schematics, etc. on request. Some other writers have
pointed out correctly that a linear supply would be a better choice than
a
noisy computer switching supply, and that one or both supplies in the
switch-
ing unit may have a minimum current requirement. That can be easily met
with
various types of loads added in parallel with the supply needing it.

For RF prototyping where I used to work, they used little single-sided
PCBs about 1" square, with adhesive backing, with a surface mount
pattern for a single chip brought out to wider pads. These were
positioned on the Cu side of a piece of PCB laminate and the circuit
wired up directly on the Cu ground plane with wire-wrap wire or self-
fluxing magnet wire. I'll ask someone there where they got the things
from. They were very cheaply made, and were free issue in the lab. I
should have liberated a few before I left. 8-(

DC has no skin effect, which is important even at 50 Hz for very large
currents. DC has no radiation losses, which is also significant at 50 Hz
over long distances. For a given RMS, DC has a 30% smaller peak current
and peak voltage. DC has no capacitively coupled current loss (not the
same as leakage current) therefore power factor loss, through the
insulation into the salt water. This capacitive current can cause
electrolysis effects.

Subject: power transmission (electric)

Hi,
I've been an engineer (manager) in the undersea cable business for 30 years and know of only a few DC cable projects for very specific applications. DC would not be an effective way to transmit power. High voltage pluse cables for digital transmission (very low current) are the only cables I know fit your discription. These are not power cables. Undersea power transmission are larger cables and are usually 5,15,35,64,130kv cables having conductors with thousands of circular mils and range from 4" to 8" diameters. There are some even larger. Cables usually contain 3 or 4 main conductors and are operated in a three phase (balanced) configuration. Today, many undersea power cables contain optical light guides (fiber optics) for signal transmission. Corona is normally controlled by proper shielding and the use of semi-con materials. External damage is the major cable failure although the we still like to get excited over the effects of "treeing" (crack propagation within a dielectric due to electro stress). If you would like any more details on cable or cable useage, drop me an email. Oxford,William & Associates: Cable Systems Consultants. wjoxford@aol.com or N4MXF@aol.com. 73 Bill

> Comments here or remove the ! to reply via e-mail...73 all, Web Williams

Well, not quite! I have to argue against two of your points or
suggestions.
The cyanide is NOT just a cleaner. The silver ions bind to the
cyanide ions in a way leaving hardly any free silver ions in the plating
solution. (One book reports about 1 free silver ion per cubic
centimeter. That is a VERY small amount of silver. An ion is
esstentially just an atom.)
Why is that important? If there are many free ions and you stick
almost any metal into the solution the silver ions will pick up an

electron from the metal and become metallic silver while one of the substrate ions will go into solution. This is the secret of "electroless" plating. Sounds wonderful, but it is not; the metal deposited this way is poorly bonded and can be often wiped off with a rag. It is also porous. Metals going into solution include copper, zinc, iron, practically anything except gold and platinum!
The other objection is rubbing silver onto a hot surface. Actually, it probably could be made to work, if you are good and work fast. The problem is that the melting point of silver is lower than the melting point of copper (probably higher than for brass), but not a lot lower (a bit over 100 degrees C.) You are at risk of melting the copper if you heat with a tourch. It would work better with a silver bath (want to melt a liter of silver in the kitchen?) with good temperature control. There is another problem; the silver and copper rapidly alloy to form a lower melting point alloy. If you do not work fast this process can cause holes to develop as the alloy forms ever deeper into the substrate. This is something you will understand better if you ever did soldering on fine copper wire with lead-tin solder. The wire disappears if you are too slow. The silver/copper process will be faster. You will get a great bond, if you are good enough.

Bob

Subject: VCO, paralelling varactors

FRANK,

I guess I was not as clear as I should have been.

1 varactor VCO ( MV109)
case 1: CFIXED = 100 PF
CVARACTOR= 2-20PF
CTOTAL= 102-120 PF
Cmax/cmin= 1.176
FreqMax/FreqMin= SQRT(1.176)= 1.085 or 8.5%

2 paralell Varactor VCO( 2*MV 109)
case 2: CFIXED = 100 PF
CVARACTOR= 4-40PF : 2 varactors in parallel
CTOTAL= 104 to 140 PF
Cmax/Cmin= 140/104= 1.346

# 2119. Re: VCO , paralleling Varactors

<Two pairs> of varactors paired connected in paralell.
Does a pair of varactors mean two varactors wired back-to-back?
This might work if you are paralelling back to back pairs of
varactors .

I tried to paralell single varactors across a LC tank of
a VCO.

Also, the circuit where I tried this varactor paralelling is in
the VCO that comes in the Ten-TEC QRP CW kit model 1340 .

The tuning range of the VCO inside this kit at 40 M is 70 KHZ.

This VCO drifts like crazy. (yes I have glued the toroid to the
PCB with hot melt glue)

This VCO uses 1 tuning diode MV2109 for tuning it. This VCO
tunes DOWN i.e. 4.00 to 3.930 for covering 7.00 to 7.070 .

I figured that sticking another varactor diode across the
already present MV2109 should make it tune something like
7010 to 7110 or so.

Boy, was I wrong! It hardly changed anything .

Anyway, how do you bias a varactor high enough at about
20-30 volts so that it does not draw current from the LC
tank circuit of the VCO and still have enough tuning range!

Well , you might use a large varactor like 100 PF varactor
and use a 20 PF bias range around 20-30 volts or.
Didnt someone tell me that large varactors have LOW Q
inherently.Also, large varactors are noisier.

Also, generating a 20-30 volt tuning voltage is a problem
in gear like this.

So, we are back to where we started.

The Ten-Tec guys do get a terrific tuning range at about 70 KHZ
on 40 M for their 1 varactor VCO, with a tuning voltage of
1-6.8 volts I think.

Well, they used to used 2 back to back varactor at one time for
VCO etc, but that increases the cost 4:1 for varactors.

I think it is nowadays more fashionable to use 1 varactors for
LC tank of VCO, even though that will reduce the circuit Q and
stability. I guess that the resultant lower cost and the use

of the VCO with a synthesizer chip is the reason for this.

So, it seems like that the varactor is drawing current from the
tuned circuit!
Well that must be shooting down the LC circuit Q as well, and,
resulting in drifting etc.

On a tangential issue, has anyone done much hobby work with the new SOT gull-wing or even surface mount packages? The "pin" spacing on some of these is getting awfully small. I've gotten a few samples of some nice IC's I's like to evaluate, but etching and soldering at those line widths makes me wonder if at some point the amateur homebrewer is going to get scraped off.

> this (Too much gain? Why would the lead length matter?)

The lead length doesn't matter so much as the circuit's design. The
problem with that circuit is that it's inherently unstable when its input
and output are tuned. (Grounding a JFET's gate doesn't shield O from I as
grounding a vacuum tube's grid can do.) The MPF102 isn't a very gainy
JFET, so if you tap the I/O tuned circuits down far enough and/or stagger
the I/O circuits' tuning, *and* there's sufficient loading at I and/or O,
the circuit may not oscillate.

That circuit also disserves you by getting much less selectivity out of two
tuned circuits than can easily be achieved with them.

A better approach is to close that book and use a circuit engineered for
predictable gain and stability. One recommendation is the single-40673
amplifier described by Wes Hayward, W7ZOI, in November 1981 *QST*'s
"Progressive Communications Receiver," later carried in many subsequent
ARRL *Handbook*s under the title "High-Performance Communications Receiver"
(it's in the 1992 edition, for instance). (Yes, 40673s are now "new old
stock," but you can also use an ECG222, NTE222, MPF131, 3N187 and 3SK
[Japanese] or BF [European] equivalents. Dual-gate MOSFETs may be passe

over in the US, but in Japan and Europe they're still very much viable. The Japanese in particular have taken receive-class JFETs and MOSFETs much further than manufacturers here; even the [old] 2SK125, for instance, is much better than the best [J310/U310] generally available here.)

When you combine Hayward's amplifier with the appropriate double-tuned-circuit output filter (described in the same article that describes the amplifier), you'll have good, predictable gain (10 dB) *and* the selectivity you need. Wes's circuit isn't the only possible solution to your problem, of course, but it has withstood the tests of time and use that the other circuit hasn't.

Regards,

David Newkirk, W9VES

MAYBE. Each device (tube, FET, MOSFET, BJT) has a diffrent set of
parameters. Even each type of tube(6J6, 6AK5, 6DJ8) differs as
to G-P, G-C, C-P capacitances, and their transconductance.

I guess the key is to design around the limitations of the device
that we are using.

These limitations are not very difficult to design around for FETs.
MPF102 is not a very good FET for RF usage. Though it
is still usable.
You can use a dual gate MOSFET like 40673 3SK174 etc,
but their is not likely to be a lot of difference between that
and a properly designed circuit using J-310.
( J-310 is a good device for general RF usage, much better than
MPF-102).

I guess the key is balance.

1.Just enough RF gain to give you a good noise figure with the antenna
and frequency you intend to use it with. Too much gain and you may
compromise the cross modulation performance. If your front end(mixer)
is sensitive enough, you might not need any RF gain atall.

2. Impedance matching. This cannot be stressed enough.
In fact they say that the key to SUCCESSFUL RF design is
impedance matching!
1.Match antenna impedance to input tuned circuit. If you have a
large antenna, use a 1 turn link to couple the antenna.
If all you have is a 6 feet whip as an antenna, connect it to the
top or the hot end of the antenna.
2. Match source impedance to input tank. Generally 2 turns should
be all that is needed.
3. Match drain impedance to output tank. Around 50% or should be good.

3. Adjust input and output loading.More loading means less circuit Q
whcih might help in adjusting BAND coverage and tracking between
input and output circuits.
Less loading will make tuning much more sharp and increase
circuit Q.
4. Having adjusted loading , you might want to go to Step 2 to fine
tune the impedance matching, though it should not be really
neccessary.

5. If you still have problems with crossmodulation, run the FET
as HOT as possible, i.e. with as much drain current as possible.

I guess around 20 mA or so.
It was stated somewhere that even a BJT can have very good
crossmodulation performance better than a dual gate MOSFET
by running it at about 20-50 mA or so.
Device linearity is greatly increased and crossmodulation reduced
by running the device hot enough.

6. Use of pads can improve cross modulation performace.
This is suggested if you have a large antenna.

7. Also, it might be good idea to bear in mind that the
Cross MOD performace of the mixer should be high enough
for you to use a RF pre amp.
DONT even think about using an preamp with a NE602 mizer front end
or general coverage portable SW radios receievers. Just use
a passive 1-2 tuned circuit filters . A lot of performance gain
can be acheived just by proper impedance matching and NO FET
rf amp.
Please think about the NO FET(or tube or transistor) RF amp also!
It produces RF gain by proper impedance matching.

From: la8ak@online.no (J M Noeding)
Subject: measuring VVC-diodes, how?

Hi
I need to calibrate capacitance diodes to voltage to use them in a
2-50MHz impedance meter. I believe it may not be a good idea to
measure the capacity using a C-meter, since signal voltage level may
be much higher than the actual dc voltage used.
I have a Radiometer Q-meter, but I would prefer an easier way than
measuring the influence on a tuned circuit.
Any better suggestions? What does manufacturers use?

>>
>>Why do power companies use DC to transmitt power. 400KV, 500MW. What
kind
>>of equipment is used to transform from AC to DC and DC to AC?
>>Could it be power factor?
>>73 and TIA
>
>The main reason is that DC is subject to only the resistance losses in
the conductors. The line inductance and capacitance does not cause
reactive voltage drop is a DC transmission line. In an AC line these
losses are serious and must be corrected wth very expensive capacitor
banks.

The reason that DC is not often used is that the cost of the high
voltage solid state conversion systems have been very expensive in the
past. Recently these cost have dropped and more DC transmission lines
are being considered and will be built.

The merits of DC vs AC power generation,transmission, and distribution
were highly debated at the turn of the century by Edison (DC) and Tesla
(AC). Tesla eventually won the debate, but with the changes in
technology of the next century, Edison and DC may be exonerated.

Either the phasing or "Weaver" techniques can be used to build a
simple "single signal" receiver and a SSB transmitter, too ... it is
possible to obtain substantial undesired sideband suppression without

too much difficulty ... especially with DSP techniques ...

Hi all,

The principle problem with the responses to this topic is that
amateurs employ what is called "pre-amps". Much of what follows this
presumption is correct, but inappropriate to SWL (due to the presumed
application of the "pre-amp").

Modestly priced receivers often used by SWL'ers do NOT need wideband
amplification, and their receivers are not atmospheric noise limited.
As already identified, filtering pays off and post-amplification would
return the filter's loss with perhaps some overall gain improvement.
The term for such a device is Pre-selector. Hams having been for
years passive in construction practices have allowed commercial
vendors to dominate design issues by virtue of offering "features."

A good receiver has front end tuning, often several tuned RF stages
prior to the first mixer. These stages are rare in current designs
having been consigned to the dust-bin by marketing department design
choices. Simply put they view that the Ham would rather have his hand
wither than reach for a "tuning" knob. That it isn't built into the
VFO knob is again a marketing issue in that cost issues arrise.
Tracking and alignment problems abound requiring the parts count to
push against the profit margin.

I have three friends with front-end overload problems from a nearyby
AM commercial station. Their rigs are top of line Kenwoods and they
suffer the same as my lowly DX-440 which cost an eighth of their
price. Both the DX-440 and these Kenwoods suffer the same design
shortfall: wide open front ends (OK so they are Band filtered, they
suffer all the same!). Pre-selectors would solve the problems all
around, but I already know my friends would shudder to have to reach
for a second knob (much less tuner). They conform to the expectations

of Marketeers and their purchases have validated the entropy of
design.

SWL'ers look for construction projects for Pre-selectors or tuned
pre-amps. This is the single greatest improvement you can make
outside of building IF ancillaries such as Q-multipliers, crystal
lattice filters, or another stage of mixing to a lower, narrower IF.
Also, do not neglect the Tuner as the cheapest means to reject noise
and interfering stations. Sophisticated tuning networks with reject
notches also keep cost low. Much of this material was present in the
ARRL Handbooks of the '60's. I hope these common engineering issues
haven't become folk-lore through neglect.

make an oven than a TCXO. A peltier heater is unnecessary as the crystal
will hace a minimum temperature coefficient above 27C
Your crystal will be an AT (lazy Z) cut optimised for minimum deviation
over the whole band. If you temperature control just the crystal it
should be possible to raise the temperature by using a servo heater to
where the crystal reaches its minimum frequencey with luck and if the
crystal is correctly cut this will be about 35C.
The Maintaining circuit will still be sensitive to temperature and will
limit any crystal only control to +-0.5ppm or so.

From: "Jeff W. Hockert" <hockerj@ece.orst.edu>
Subject: 2 meter antenna

I've just finished building a variation on this sleeve antenna which seems to work OK. I need to borrow a VHF SWR bridge and trim it yet, and then I can compare it to the J-Pole I've been using. My question is, should the two sides of the dipole be shorted together?

My antenna is constructed with 1/2 wavelength of copper 3/4" pipe over the feeding coax, with the braid shorted to the pipe at the midpoint of the antenna. The other half the dipole is base loaded to be electrically 3/4 wavelength long and physically 5/8 wavelength (I used a section of 1/8" steel rod with the coil making up the remainder of the length... I used a piece of solid phenolic plastic rod that plugs the end of the copper pipe and extends up as the coil form, and drilled out the center of the rod to set the steel element in). I am currently feeding the base of the loading coil with the coax center conductor, and do NOT have the two halves shorted... is this correct?

TIA,
Jason, N7IME

Hi Dave

I've done quite a bit of work with SM packages in my microwave work. There is no real problems, any more than with other type, the R's and C's take a bit of geting used to (they fly round the shack really well if you get the mounting wrong!), but it just requires new skills to be learnt, but certainly not difficult or impossible for Mr Average Ham.

it is fairly easy to go much further down than this!
With 2x 1N270, or better AA119 type germanium diodes and CA3140E
OP-amp you can measure down below -46dBm up to at least 600MHz.

I made a correction amplifier using several 1N4148 for each range, but
today, I would have tried a CA3140E buffer, with a possible log.amp
and connect this to a datalogger, which may be calibrated for every
10dB range, with some possible frequency calibration (like the one you
have on SHF power meters). With this circuit you might measure below
-40dBm on 1,296GHz, and still have useful sensitivity above 2.320 GHz.
But you have to calibrate the circuit yourself. This is accomplished
by borrowing a signal generator from work or from a friend (most SHF
friends have some sort of reliable signal generators)

Subject: Antenna rotator control box schematic needed.

I am looking for plans for a tv antenna rotator. It is one of the ones that
the antenna mast goes through. It is a 4 wire, with the wires connected
internally as follows:

1: Black, Motor common
2:Yellow , motor, switch NO

3:red , motor,switch NC
4:blue , switch common through 27 Ohm 5W Resistor.

The switch opens/closes about 30+ times per revolution of the mast.

I would like to build an electronic control box using discrete TTL chips if possible.

the ceramic resonnators are fine for oscillators, and they may be
pulled more than comparative xtals. I am sure you may use them for
filters, I have seen a BP-filter for 7MHz band using such devices

I posted some info on a newsgroup some times, but obviously this
attracted little interest or nobody makes any experiments any more?
I have made experiments with oscillators using ceramic resonators for
250, 480, 960kHz, and 3,58, 4.0 MHz
it is easy to pull a 3.58MHz element to cover 3.5-3,6MHz in a VFO
An oscillators using ceramic resonnators should have some 3 times
higher capacitor values than xtal oscillators to operate
satisfactorily

From: k3ky@juno.COM (David E Sinclair)
Subject: Cheap/decent 12V supply?

Using the 12V supply only from a 5V/12V computer supply probably would
not
work well for charging a 12V lead/acid car battery. More voltage is
needed. If
the two supplies in the computer unit are not ground referenced, then
they
could be series-connected for 17V. Some simple circuitry could be used to
control or limit the battery charge current. There are several approaches
such as constant voltage, constant current, taper charging, etc. I will
be glad
to supply references/schematics, etc. on request. Some other writers have
pointed out correctly that a linear supply would be a better choice than

a
noisy computer switching supply, and that one or both supplies in the
switch-
ing unit may have a minimum current requirement. That can be easily met
with
various types of loads added in parallel with the supply needing it.

For RF prototyping where I used to work, they used little single-sided
PCBs about 1" square, with adhesive backing, with a surface mount
pattern for a single chip brought out to wider pads. These were
positioned on the Cu side of a piece of PCB laminate and the circuit
wired up directly on the Cu ground plane with wire-wrap wire or self-
fluxing magnet wire. I'll ask someone there where they got the things
from. They were very cheaply made, and were free issue in the lab. I
should have liberated a few before I left. 8-(

DC has no skin effect, which is important even at 50 Hz for very large
currents. DC has no radiation losses, which is also significant at 50 Hz
over long distances. For a given RMS, DC has a 30% smaller peak current

and peak voltage. DC has no capacitively coupled current loss (not the same as leakage current) therefore power factor loss, through the insulation into the salt water. This capacitive current can cause electrolysis effects.

Subject: power transmission (electric)

Hi,
I've been an engineer (manager) in the undersea cable business for 30 years and know of only a few DC cable projects for very specific applications. DC would not be an effective way to transmit power. High voltage pluse cables for digital transmission (very low current) are the only cables I know fit your discription. These are not power cables. Undersea power transmission are larger cables and are usually 5,15,35,64,130kv cables having conductors with thousands of circular mils and range from 4" to 8" diameters. There are some even larger. Cables usually contain 3 or 4 main conductors and are operated in a three phase (balanced) configuration. Today, many undersea power cables contain optical light guides (fiber optics) for signal transmission. Corona is normally controlled by proper shielding and the use of semi-con materials. External damage is the major cable failure although the we still like to get excited over the effects of "treeing" (crack propagation within a dielectric due to electro stress). If you would like any more details on cable or cable useage, drop me an email. Oxford,William & Associates: Cable Systems Consultants. wjoxford@aol.com or N4MXF@aol.com. 73 Bill

Well, not quite! I have to argue against two of your points or
suggestions.
The cyanide is NOT just a cleaner. The silver ions bind to the
cyanide ions in a way leaving hardly any free silver ions in the plating
solution. (One book reports about 1 free silver ion per cubic
centimeter. That is a VERY small amount of silver. An ion is
esstentially just an atom.)
Why is that important? If there are many free ions and you stick
almost any metal into the solution the silver ions will pick up an
electron from the metal and become metallic silver while one of the
substrate ions will go into solution. This is the secret of
"electroless" plating. Sounds wonderful, but it is not; the metal
deposited this way is poorly bonded and can be often wiped off with a
rag. It is also porous. Metals going into solution include copper,
zinc, iron, practically anything except gold and platinum!
The other objection is rubbing silver onto a hot surface. Actually,
it probably could be made to work, if you are good and work fast. The
problem is that the melting point of silver is lower than the melting
point of copper (probably higher than for brass), but not a lot lower (a
bit over 100 degrees C.) You are at risk of melting the copper if you
heat with a tourch. It would work better with a silver bath (want to
melt a liter of silver in the kitchen?) with good temperature control.
There is another problem; the silver and copper rapidly alloy to form
a lower melting point alloy. If you do not work fast this process can
cause holes to develop as the alloy forms ever deeper into the
substrate. This is something you will understand better if you ever did
soldering on fine copper wire with lead-tin solder. The wire disappears
if you are too slow. The silver/copper process will be faster. You will
get a great bond, if you are good enough.

Subject: VCO, paralelling varactors

FRANK,

I guess I was not as clear as I should have been.

1 varactor VCO ( MV109)
case 1: CFIXED = 100 PF
CVARACTOR= 2-20PF
CTOTAL= 102-120 PF
Cmax/cmin= 1.176
FreqMax/FreqMin= SQRT(1.176)= 1.085 or 8.5%

2 paralell Varactor VCO( 2*MV 109)
case 2: CFIXED = 100 PF
CVARACTOR= 4-40PF : 2 varactors in parallel
CTOTAL= 104 to 140 PF

Cmax/Cmin= 140/104= 1.346

----------------------------------
FreqMax/FreqMin= SQRT(1.346)= 1.16= 16%

Thus the max to min capacity should change.

But I could not detect the change in frequency coverage
after adding the second varactor.
(Maybe I made an error in my experiment.)

I guess that my question was, is the maximum capacity really
going to double when you paralell another varactor across the
varactor of a VCO. I am specificall talking about (1 varactor

VCO) and NOT the 2 back-to-back varactor VCO.

I dont really know, but, I think that the one varactor VCO
drives the varactors in a highly non-linear way.There will be 5-10
volts RF/AC across the varactor, and 1-10 volts DC to tune it.
Thus, I believe that varactor will be working in a highly nonlinear
way. Also, Q is rather low for these types of varactors.

Anyway, I try this varactor paralleling again, and hopefully I had
done something wrong earlier, and paralelling varactors really
does increase their max capacity in case of a VCO.

Thanks for your thoughts.

Sounds like the conditions are similar to the parametric amplifier or varactor tripler :-).

If the high RF voltage across the varactor is your problem, then why not use a varactor with large maximum capacitance (a tuning range from ,say, 25 pF to 250 pF) in series with a small (say 100 pF) fixed capacitor. The two capacitances will form a capacitive voltage divider, at the minimum capacitance the AC voltage across the varactor is only slightly reduced but at maximum capacitance only a very small fraction of the RF voltage is across the varactor (2/7 in this case). This greatly reduces the risk for forward biasing at low tuning voltages.

Your problem seem to be the large parallel capacitance, so it is quite unrealistic to expect to get any large tuning range with varactors with low maximum capacitance. With values in my example, you would get sqrt ( (100+71)pF/(100+20)pF ) = 1.19 or 19 %. Using a larger series capacitance would make the tuning range even larger, but it would also increase the RF voltage across the varactor.

From: "P. Singh" <singhpk@NOSPAM.exit109.com>
Subject: VCO , paralleling Varactors

Does anybody know why paralelling another varactor across
the varactor of a LC Voltage controlled oscilator not increase
the tuning range of the VCO?

Both the varactors are reverse biased by the tuning voltage,
as varactors should be. So, connecting another varactor
across the LC tank circuit of a VCO should increase the freq
range of the VCO by 50% or so. It only does so by 1-5%. WHY?

They AC voltage across the tank circuit is going to be about 10 volts
or so. The DC bias voltage for the varactor is about 1-10 volts or so.
So, is it that the varactor is working in a totally nonlinear way?

Will connecting two varactors back-to-back and then paralelling
work. Or they still might be operating in a non linear way?

Does any body have any experience with paralelling single varactors
across the LC tank circuit of VCO.

ANy insight / help is greatly appreciated.

Thanks

> (snip)

Maybe you should have a look at a more recent issue? My latest
copy (1996) discusses regens as primarily a historical thing, but
considers direct conversion receivers to be an effective way of
receiving signals.

I can think of a number of important designs between 1988 and 1996
that would have changed the perception of DC receivers as cute toys,
but not serious receivers...

As always, you get what you pay for. An extremely simple receiver
will get the job done under some circumstances, but may not
hold up under extreme conditions.

<snip>

Perhaps the problem with paralleling two varactors is that the two diodes is not matched, resulting in more current flowing in one of the diodes.
Try using two resistors (and RFCs), to separate the bias voltages, and use two (relatively) large capacitors in series with the HF path. I'm too lazy to try to draw it in ascii, but I hope you get the idea.

I haven't actually tested this, it is just a guess.

Please post your results, if you try it out.

Do you have web access? Analog Devices home page has a search engine at
the opening screen. I entered AD737 and got it. They're www.analog.com.

I've used the 737 in a signal measuring setup before, and it's a pretty
good chip. There are easier ways (i.e., more ham like). Pretty sure that
Solid State Design for the Radio Amateur covers these if you'd rather.
They involve using differential hot carrier diodes driving an op amp,
with perhaps some bias to get down to the -20 dBm level.

73,
Bob

Subject: 11volts from 12 volts...

Hi bill,

Almost every 12 volt supply I have built using a 3 terminal
fixed regulator puts out about 11.5 volts or so. It seems
that the 12 volt regulators are manufactured with WIDE

tolerances.

Just use a diode or two in the ground lead of your 3 terminal reg
to increase output 11 volts to 12 volts or so.

D1, D2= In4001
C1= 10uf/16volts electrolytic

These cheap switching power supplies are terrible choices for radio use,
far too noisy. Best is battery ONLY...a decent 12V Lead Acid car battery
used AS-IS (sans charger) then when you switch OFF your set up...you
turn ON the charger.
Simple, Cheap, loads of current and, best of all, quiet.
friend,
Lute

Text from original message follows:
---
years passive in construction practices have allowed commercial
vendors to dominate design issues by virtue of offering "features."

A good receiver has front end tuning, often several tuned RF stages
prior to the first mixer. These stages are rare in current designs
having been consigned to the dust-bin by marketing department design
choices. Simply put they view that the Ham would rather have his hand
wither than reach for a "tuning" knob. That it isn't built into the
VFO knob is again a marketing issue in that cost issues arrise.
Tracking and alignment problems abound requiring the parts count to
push against the profit margin.

I have three friends with front-end overload problems from a nearyby
AM commercial station. Their rigs are top of line Kenwoods and they
suffer the same as my lowly DX-440 which cost an eighth of their
price. Both the DX-440 and these Kenwoods suffer the same design
shortfall: wide open front ends (OK so they are Band filtered, they
suffer all the same!). Pre-selectors would solve the problems all
around, but I already know my friends would shudder to have to reach
for a second knob (much less tuner). They conform to the expectations
of Marketeers and their purchases have validated the entropy of
design.

SWL'ers look for construction projects for Pre-selectors or tuned
pre-amps. This is the single greatest improvement you can make
outside of building IF ancillaries such as Q-multipliers, crystal
lattice filters, or another stage of mixing to a lower, narrower IF.
Also, do not neglect the Tuner as the cheapest means to reject noise
and interfering stations. Sophisticated tuning networks with reject
notches also keep cost low. Much of this material was present in the
ARRL Handbooks of the '60's. I hope these common engineering issues
haven't become folk-lore through neglect.

make an oven than a TCXO. A peltier heater is unnecessary as the crystal
will hace a minimum temperature coefficient above 27C
Your crystal will be an AT (lazy Z) cut optimised for minimum deviation
over the whole band. If you temperature control just the crystal it
should be possible to raise the temperature by using a servo heater to
where the crystal reaches its minimum frequencey with luck and if the
crystal is correctly cut this will be about 35C.
The Maintaining circuit will still be sensitive to temperature and will
limit any crystal only control to +-0.5ppm or so.

From: "Jeff W. Hockert" <hockerj@ece.orst.edu>
Subject: 2 meter antenna

I've just finished building a variation on this sleeve antenna which seems
to work OK. I need to borrow a VHF SWR bridge and trim it yet, and then I
can compare it to the J-Pole I've been using. My question is, should the
two sides of the dipole be shorted together?

My antenna is constructed with 1/2 wavelength of copper 3/4" pipe over the
feeding coax, with the braid shorted to the pipe at the midpoint of the
antenna. The other half the dipole is base loaded to be electrically 3/4
wavelength long and physically 5/8 wavelength (I used a section of 1/8"
steel rod with the coil making up the remainder of the length... I used a
piece of solid phenolic plastic rod that plugs the end of the copper pipe
and extends up as the coil form, and drilled out the center of the rod to
set the steel element in). I am currently feeding the base of the loading
coil with the coax center conductor, and do NOT have the two halves
shorted... is this correct?

TIA,
Jason, N7IME

Hi Dave

I've done quite a bit of work with SM packages in my microwave work.
There is no real problems, any more than with other type, the R's and
C's take a bit of geting used to (they fly round the shack really well
if you get the mounting wrong!), but it just requires new skills to be
learnt, but certainly not difficult or impossible for Mr Average Ham.

# 2127. Sale: Philips BGY35Z (22W output) power modules for 132-156MHz

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-24 00:00:00 UTC
From: Joakim Langlet <joakim@seaview.se>
Message-ID: <01bcb0d0$2b070de0$320564c3@farsan>
Source record: 91497

Dear Fellow Hams!
I have a few Philips power modules (BGY35Z) that should be used rather than be sitting on
a shelf. BGY35Z is a special selection of BGY35, which has a higher guaranteed output
power.

Input power is 300 mW and power supply is 12.5V.

I am offering these modules, which data sheet for $100 excluding freight and handling.
These are unused parts.

73 de SM0OET

Joakim Langlet

9. TEST-EQUIPMENT
10. YUPI
-----

MFJ-AMERITRON is a mailing list (reflector) devoted to the
discussion of radio equipment manufactured by MFJ Enterprises
of Starkville, Ms and affiliates (Ameritron, Mirage, etc).

* Amateur Radio Equipment
* Multimode, Packet Data Controllers
* HF and VHF Amplifiers
* Accessories
* QRP, VHF, Test Instruments
* Buy, Sell
* Anything MFJ Related

To join the mailing list, send email as follows:
TO: majordomo@qth.net
SUBJECT:
BODY: subscribe MFJ-AMERITRON

To be removed from the mailing list, send email as follows:
TO: majordomo@qth.net
SUBJECT:
BODY: unsubscribe MFJ-AMERITRON

To post to the mailing list, send email as follows:
TO: MFJ-AMERITRON@qth.net

This reflector is provided by Al Waller K3TKJ at no
cost and I (K7ON) perform the routine administrivia.

Please contact me with any questions: k7on@qth.net

-----
```

GPS is a mailing list (reflector) devoted to the
discussion of the Global Positioning System and
uses relating to amateur radio, experimenting, or
other activities.

* Hand Held GPS Units
* Trackers
* Amateur Radio Applications
* Interfacing
* Buy, Sell
* Anything GPS Related

To join the mailing list, send email as follows:
TO: majordomo@qth.net
SUBJECT:
BODY: subscribe GPS

To be removed from the mailing list, send email as follows:

it is fairly easy to go much further down than this!
With 2x 1N270, or better AA119 type germanium diodes and CA3140E
OP-amp you can measure down below -46dBm up to at least 600MHz.

I made a correction amplifier using several 1N4148 for each range, but
today, I would have tried a CA3140E buffer, with a possible log.amp
and connect this to a datalogger, which may be calibrated for every
10dB range, with some possible frequency calibration (like the one you
have on SHF power meters). With this circuit you might measure below
-40dBm on 1,296GHz, and still have useful sensitivity above 2.320 GHz.
But you have to calibrate the circuit yourself. This is accomplished
by borrowing a signal generator from work or from a friend (most SHF
friends have some sort of reliable signal generators)

From: tait@primeline.net (Gary Tait)

Subject: Antenna rotator control box schematic needed.

I am looking for plans for a tv antenna rotator. It is one of the ones that the antenna mast goes through. It is a 4 wire, with the wires connected internally as follows:

1: Black, Motor common
2:Yellow , motor, switch NO
3:red , motor,switch NC
4:blue , switch common through 27 Ohm 5W Resistor.

The switch opens/closes about 30+ times per revolution of the mast.

I would like to build an electronic control box using discrete TTL chips if possible.

the ceramic resonnators are fine for oscillators, and they may be
pulled more than comparative xtals. I am sure you may use them for
filters, I have seen a BP-filter for 7MHz band using such devices

I posted some info on a newsgroup some times, but obviously this
attracted little interest or nobody makes any experiments any more?
I have made experiments with oscillators using ceramic resonators for
250, 480, 960kHz, and 3,58, 4.0 MHz
it is easy to pull a 3.58MHz element to cover 3.5-3,6MHz in a VFO
An oscillators using ceramic resonnators should have some 3 times
higher capacitor values than xtal oscillators to operate
satisfactorily

From: k3ky@juno.COM (David E Sinclair)
Subject: Cheap/decent 12V supply?

Using the 12V supply only from a 5V/12V computer supply probably would
not
work well for charging a 12V lead/acid car battery. More voltage is
needed. If
the two supplies in the computer unit are not ground referenced, then

they
could be series-connected for 17V. Some simple circuitry could be used to
control or limit the battery charge current. There are several approaches
such as constant voltage, constant current, taper charging, etc. I will
be glad
to supply references/schematics, etc. on request. Some other writers have
pointed out correctly that a linear supply would be a better choice than
a
noisy computer switching supply, and that one or both supplies in the
switch-
ing unit may have a minimum current requirement. That can be easily met
with
various types of loads added in parallel with the supply needing it.

For RF prototyping where I used to work, they used little single-sided
PCBs about 1" square, with adhesive backing, with a surface mount
pattern for a single chip brought out to wider pads. These were
positioned on the Cu side of a piece of PCB laminate and the circuit
wired up directly on the Cu ground plane with wire-wrap wire or self-
fluxing magnet wire. I'll ask someone there where they got the things

from. They were very cheaply made, and were free issue in the lab. I
should have liberated a few before I left. 8-(

DC has no skin effect, which is important even at 50 Hz for very large currents. DC has no radiation losses, which is also significant at 50 Hz over long distances. For a given RMS, DC has a 30% smaller peak current and peak voltage. DC has no capacitively coupled current loss (not the same as leakage current) therefore power factor loss, through the insulation into the salt water. This capacitive current can cause electrolysis effects.

Subject: power transmission (electric)

Hi,
I've been an engineer (manager) in the undersea cable business for 30 years and know of only a few DC cable projects for very specific applications. DC would not be an effective way to transmit power. High voltage pluse cables for digital transmission (very low current) are the only cables I know fit your discription. These are not power cables. Undersea power transmission are larger cables and are usually 5,15,35,64,130kv cables having conductors with thousands of circular mils and range from 4" to 8" diameters. There are some even larger. Cables usually contain 3 or 4 main conductors and are operated in a three phase (balanced) configuration. Today, many undersea power cables contain optical light guides (fiber optics) for signal transmission. Corona is normally controlled by proper shielding and the use of semi-con materials. External damage is the major cable failure although the we still like to get excited over the effects of "treeing" (crack propagation within a dielectric due to electro stress). If you would like any more details on cable or cable useage, drop me an email. Oxford,William & Associates: Cable Systems Consultants. wjoxford@aol.com or N4MXF@aol.com. 73 Bill

Well, you might consider subscribing. You can do it through the League at their regular address or FAX number, or even I suspect thru their bulletin board.

It probably gets about as sticky though as we have it getting RadComm across the pond.

Well, not quite! I have to argue against two of your points or
suggestions.
The cyanide is NOT just a cleaner. The silver ions bind to the
cyanide ions in a way leaving hardly any free silver ions in the plating
solution. (One book reports about 1 free silver ion per cubic
centimeter. That is a VERY small amount of silver. An ion is
esstentially just an atom.)
Why is that important? If there are many free ions and you stick
almost any metal into the solution the silver ions will pick up an
electron from the metal and become metallic silver while one of the
substrate ions will go into solution. This is the secret of
"electroless" plating. Sounds wonderful, but it is not; the metal
deposited this way is poorly bonded and can be often wiped off with a
rag. It is also porous. Metals going into solution include copper,
zinc, iron, practically anything except gold and platinum!
The other objection is rubbing silver onto a hot surface. Actually,
it probably could be made to work, if you are good and work fast. The
problem is that the melting point of silver is lower than the melting
point of copper (probably higher than for brass), but not a lot lower (a
bit over 100 degrees C.) You are at risk of melting the copper if you
heat with a tourch. It would work better with a silver bath (want to
melt a liter of silver in the kitchen?) with good temperature control.
There is another problem; the silver and copper rapidly alloy to form
a lower melting point alloy. If you do not work fast this process can
cause holes to develop as the alloy forms ever deeper into the
substrate. This is something you will understand better if you ever did
soldering on fine copper wire with lead-tin solder. The wire disappears
if you are too slow. The silver/copper process will be faster. You will
get a great bond, if you are good enough.

Bob

Subject: VCO, paralelling varactors

FRANK,

I guess I was not as clear as I should have been.

1 varactor VCO ( MV109)
case 1: CFIXED = 100 PF
CVARACTOR= 2-20PF

CTOTAL= 102-120 PF
Cmax/cmin= 1.176
FreqMax/FreqMin= SQRT(1.176)= 1.085 or 8.5%

2 paralell Varactor VCO( 2*MV 109)
case 2: CFIXED = 100 PF
CVARACTOR= 4-40PF : 2 varactors in parallel
CTOTAL= 104 to 140 PF
Cmax/Cmin= 140/104= 1.346

FreqMax/FreqMin= SQRT(1.346)= 1.16= 16%

Thus the max to min capacity should change.

But I could not detect the change in frequency coverage
after adding the second varactor.
(Maybe I made an error in my experiment.)

I guess that my question was, is the maximum capacity really
going to double when you paralell another varactor across the
varactor of a VCO. I am specificall talking about (1 varactor
VCO) and NOT the 2 back-to-back varactor VCO.

I dont really know, but, I think that the one varactor VCO
drives the varactors in a highly non-linear way.There will be 5-10
volts RF/AC across the varactor, and 1-10 volts DC to tune it.
Thus, I believe that varactor will be working in a highly nonlinear
way. Also, Q is rather low for these types of varactors.

Anyway, I try this varactor paralleling again, and hopefully I had
done something wrong earlier, and paralelling varactors really
does increase their max capacity in case of a VCO.

Thanks for your thoughts.

further than manufacturers here; even the [old] 2SK125, for instance, is
much better than the best [J310/U310] generally available here.)

When you combine Hayward's amplifier with the appropriate
double-tuned-circuit output filter (described in the same article that
describes the amplifier), you'll have good, predictable gain (10 dB) *and*
the selectivity you need. Wes's circuit isn't the only possible solution
to your problem, of course, but it has withstood the tests of time and use
that the other circuit hasn't.

MAYBE. Each device (tube, FET, MOSFET, BJT) has a diffrent set of
parameters. Even each type of tube(6J6, 6AK5, 6DJ8) differs as
to G-P, G-C, C-P capacitances, and their transconductance.

I guess the key is to design around the limitations of the device
that we are using.

These limitations are not very difficult to design around for FETs.
MPF102 is not a very good FET for RF usage. Though it
is still usable.
You can use a dual gate MOSFET like 40673 3SK174 etc,
but their is not likely to be a lot of difference between that
and a properly designed circuit using J-310.
( J-310 is a good device for general RF usage, much better than
MPF-102).

I guess the key is balance.

1.Just enough RF gain to give you a good noise figure with the antenna
and frequency you intend to use it with. Too much gain and you may
compromise the cross modulation performance. If your front end(mixer)
is sensitive enough, you might not need any RF gain atall.

2. Impedance matching. This cannot be stressed enough.
In fact they say that the key to SUCCESSFUL RF design is
impedance matching!
1.Match antenna impedance to input tuned circuit. If you have a
large antenna, use a 1 turn link to couple the antenna.
If all you have is a 6 feet whip as an antenna, connect it to the

top or the hot end of the antenna.
2. Match source impedance to input tank. Generally 2 turns should
be all that is needed.
3. Match drain impedance to output tank. Around 50% or should be good.

3. Adjust input and output loading.More loading means less circuit Q
whcih might help in adjusting BAND coverage and tracking between
input and output circuits.
Less loading will make tuning much more sharp and increase
circuit Q.
4. Having adjusted loading , you might want to go to Step 2 to fine
tune the impedance matching, though it should not be really
neccessary.

5. If you still have problems with crossmodulation, run the FET
as HOT as possible, i.e. with as much drain current as possible.
I guess around 20 mA or so.
It was stated somewhere that even a BJT can have very good
crossmodulation performance better than a dual gate MOSFET
by running it at about 20-50 mA or so.
Device linearity is greatly increased and crossmodulation reduced
by running the device hot enough.

6. Use of pads can improve cross modulation performace.
This is suggested if you have a large antenna.

7. Also, it might be good idea to bear in mind that the
Cross MOD performace of the mixer should be high enough
for you to use a RF pre amp.
DONT even think about using an preamp with a NE602 mizer front end
or general coverage portable SW radios receievers. Just use
a passive 1-2 tuned circuit filters . A lot of performance gain
can be acheived just by proper impedance matching and NO FET
rf amp.
Please think about the NO FET(or tube or transistor) RF amp also!
It produces RF gain by proper impedance matching.

From: la8ak@online.no (J M Noeding)
Subject: measuring VVC-diodes, how?

Hi
I need to calibrate capacitance diodes to voltage to use them in a
2-50MHz impedance meter. I believe it may not be a good idea to
measure the capacity using a C-meter, since signal voltage level may
be much higher than the actual dc voltage used.

I have a Radiometer Q-meter, but I would prefer an easier way than
measuring the influence on a tuned circuit.
Any better suggestions? What does manufacturers use?

>>
>>Why do power companies use DC to transmitt power. 400KV, 500MW. What kind
>>of equipment is used to transform from AC to DC and DC to AC?
>>Could it be power factor?
>>73 and TIA
>

>The main reason is that DC is subject to only the resistance losses in the conductors. The line inductance and capacitance does not cause reactive voltage drop is a DC transmission line. In an AC line these losses are serious and must be corrected wth very expensive capacitor banks.

The reason that DC is not often used is that the cost of the high voltage solid state conversion systems have been very expensive in the past. Recently these cost have dropped and more DC transmission lines are being considered and will be built.

The merits of DC vs AC power generation,transmission, and distribution were highly debated at the turn of the century by Edison (DC) and Tesla (AC). Tesla eventually won the debate, but with the changes in technology of the next century, Edison and DC may be exonerated.

Either the phasing or "Weaver" techniques can be used to build a simple "single signal" receiver and a SSB transmitter, too ... it is possible to obtain substantial undesired sideband suppression without too much difficulty ... especially with DSP techniques ...

Hi all,

The principle problem with the responses to this topic is that
amateurs employ what is called "pre-amps". Much of what follows this
presumption is correct, but inappropriate to SWL (due to the presumed
application of the "pre-amp").

Modestly priced receivers often used by SWL'ers do NOT need wideband
amplification, and their receivers are not atmospheric noise limited.
As already identified, filtering pays off and post-amplification would
return the filter's loss with perhaps some overall gain improvement.
The term for such a device is Pre-selector. Hams having been for

Problem solved. It was the Canned Diode (1N1239) inserted into the 5r4 octal socket. After trrouble shooting (dissconnect the caps, measure the resistance, measure the transformer winding resistances, etc, I looked at the socket that the diode can was plugged into. H.m.m.m still had the filament winding leads in place. So I replaced the diode with a tube from my handy dandy flea market stock and voila.... Now all I need is to uphgrade my license so I can work six and two meters. PS, when I powered it up I had an oil filled dummy load that my son helped me build one summer....

Hi
Thanks for reading this msg.

I came across an artical in one of the Radio Mags
(but can not remeber which one)
the artical gave details for rx geo weather sats 1.6ghz
converter.
By taking out the tuner of a bsb or dmac sat rx
(can not remember which) and building a discone
with a couple of preamp built into the discone.
the tuner has a 137mgz out put which is then connected
to a wide band rx.
i did have all the papper work which i have lost
the mag did do a follow up to build a rx to rx 137mhz
what i require is the name of the mag to get a back
issue or a photo copy
thanks again
Poul G7BTP

Sounds like the conditions are similar to the parametric amplifier or
varactor tripler :-).

If the high RF voltage across the varactor is your problem, then why
not use a varactor with large maximum capacitance (a tuning range from
,say, 25 pF to 250 pF) in series with a small (say 100 pF) fixed
capacitor. The two capacitances will form a capacitive voltage
divider, at the minimum capacitance the AC voltage across the varactor
is only slightly reduced but at maximum capacitance only a very small
fraction of the RF voltage is across the varactor (2/7 in this case).
This greatly reduces the risk for forward biasing at low tuning
voltages.

Your problem seem to be the large parallel capacitance, so it is quite
unrealistic to expect to get any large tuning range with varactors
with low maximum capacitance. With values in my example, you would get
sqrt ( (100+71)pF/(100+20)pF ) = 1.19 or 19 %. Using a larger series
capacitance would make the tuning range even larger, but it would also
increase the RF voltage across the varactor.

From: "P. Singh" <singhpk@NOSPAM.exit109.com>
Subject: VCO , paralleling Varactors

Does anybody know why paralelling another varactor across
the varactor of a LC Voltage controlled oscilator not increase
the tuning range of the VCO?

Both the varactors are reverse biased by the tuning voltage,
as varactors should be. So, connecting another varactor
across the LC tank circuit of a VCO should increase the freq
range of the VCO by 50% or so. It only does so by 1-5%. WHY?

They AC voltage across the tank circuit is going to be about 10 volts
or so. The DC bias voltage for the varactor is about 1-10 volts or so.
So, is it that the varactor is working in a totally nonlinear way?

Will connecting two varactors back-to-back and then paralelling
work. Or they still might be operating in a non linear way?

Does any body have any experience with paralelling single varactors
across the LC tank circuit of VCO.

ANy insight / help is greatly appreciated.

Thanks

> (snip)

Maybe you should have a look at a more recent issue? My latest
copy (1996) discusses regens as primarily a historical thing, but
considers direct conversion receivers to be an effective way of
receiving signals.

I can think of a number of important designs between 1988 and 1996
that would have changed the perception of DC receivers as cute toys,
but not serious receivers...

As always, you get what you pay for. An extremely simple receiver
will get the job done under some circumstances, but may not
hold up under extreme conditions.

From: norman <norsan@bright.net>
Subject: Value of Dow-Key relay?

Dow key relays can be used for much more than switching from transmit to receive in boatanchors. Some uses are:

switching between 2 antennas
switching in/out a preamplifier at the antenna
switching transverters to a common IF
switching rigs to a SWR meter

and many more.

<snip>

Perhaps the problem with paralleling two varactors is that the two diodes is not matched, resulting in more current flowing in one of the diodes.
Try using two resistors (and RFCs), to separate the bias voltages, and use two (relatively) large capacitors in series with the HF path. I'm too lazy to try to draw it in ascii, but I hope you get the idea.

I haven't actually tested this, it is just a guess.

Please post your results, if you try it out.

Do you have web access? Analog Devices home page has a search engine at
the opening screen. I entered AD737 and got it. They're www.analog.com.

I've used the 737 in a signal measuring setup before, and it's a pretty
good chip. There are easier ways (i.e., more ham like). Pretty sure that
Solid State Design for the Radio Amateur covers these if you'd rather.
They involve using differential hot carrier diodes driving an op amp,
with perhaps some bias to get down to the -20 dBm level.

73,
Bob

Subject: 11volts from 12 volts...

Hi bill,

Almost every 12 volt supply I have built using a 3 terminal
fixed regulator puts out about 11.5 volts or so. It seems
that the 12 volt regulators are manufactured with WIDE
tolerances.

Just use a diode or two in the ground lead of your 3 terminal reg
to increase output 11 volts to 12 volts or so.

D1, D2= In4001
C1= 10uf/16volts electrolytic

These cheap switching power supplies are terrible choices for radio use,
far too noisy. Best is battery ONLY...a decent 12V Lead Acid car battery
used AS-IS (sans charger) then when you switch OFF your set up...you
turn ON the charger.
Simple, Cheap, loads of current and, best of all, quiet.
friend,
Lute

make an oven than a TCXO. A peltier heater is unnecessary as the crystal
will hace a minimum temperature coefficient above 27C
Your crystal will be an AT (lazy Z) cut optimised for minimum deviation
over the whole band. If you temperature control just the crystal it
should be possible to raise the temperature by using a servo heater to
where the crystal reaches its minimum frequencey with luck and if the
crystal is correctly cut this will be about 35C.
The Maintaining circuit will still be sensitive to temperature and will
limit any crystal only control to +-0.5ppm or so.

From: "Jeff W. Hockert" <hockerj@ece.orst.edu>
Subject: 2 meter antenna

I've just finished building a variation on this sleeve antenna which seems to work OK. I need to borrow a VHF SWR bridge and trim it yet, and then I can compare it to the J-Pole I've been using. My question is, should the two sides of the dipole be shorted together?

My antenna is constructed with 1/2 wavelength of copper 3/4" pipe over the feeding coax, with the braid shorted to the pipe at the midpoint of the antenna. The other half the dipole is base loaded to be electrically 3/4 wavelength long and physically 5/8 wavelength (I used a section of 1/8" steel rod with the coil making up the remainder of the length... I used a piece of solid phenolic plastic rod that plugs the end of the copper pipe and extends up as the coil form, and drilled out the center of the rod to set the steel element in). I am currently feeding the base of the loading coil with the coax center conductor, and do NOT have the two halves shorted... is this correct?

TIA,
Jason, N7IME

Hi Dave

I've done quite a bit of work with SM packages in my microwave work. There is no real problems, any more than with other type, the R's and C's take a bit of geting used to (they fly round the shack really well if you get the mounting wrong!), but it just requires new skills to be learnt, but certainly not difficult or impossible for Mr Average Ham.

On a tangential issue, has anyone done much hobby work with the new SOT gull-wing or even surface mount packages? The "pin" spacing on some of these is getting awfully small. I've gotten a few samples of some nice IC's I's like to evaluate, but etching and soldering at those line widths makes me wonder if at some point the amateur homebrewer is going to get scraped off.

I was issued a 454 when I joined a research project at the University
of Essex in 1970. The only more beautiful thing was the young lady
who came with it. (The 454 is no longer with me).

> resonant frequency? Can someone explain WHY this circuit is doing
> this (Too much gain? Why would the lead length matter?)

The lead length doesn't matter so much as the circuit's design. The problem with that circuit is that it's inherently unstable when its input and output are tuned. (Grounding a JFET's gate doesn't shield O from I as grounding a vacuum tube's grid can do.) The MPF102 isn't a very gainy JFET, so if you tap the I/O tuned circuits down far enough and/or stagger the I/O circuits' tuning, *and* there's sufficient loading at I and/or O, the circuit may not oscillate.

That circuit also disserves you by getting much less selectivity out of two tuned circuits than can easily be achieved with them.

A better approach is to close that book and use a circuit engineered for predictable gain and stability. One recommendation is the single-40673 amplifier described by Wes Hayward, W7ZOI, in November 1981 *QST*'s "Progressive Communications Receiver," later carried in many subsequent ARRL *Handbook*s under the title "High-Performance Communications Receiver" (it's in the 1992 edition, for instance). (Yes, 40673s are now "new old stock," but you can also use an ECG222, NTE222, MPF131, 3N187 and 3SK [Japanese] or BF [European] equivalents. Dual-gate MOSFETs may be passe over in the US, but in Japan and Europe they're still very much viable. The Japanese in particular have taken receive-class JFETs and MOSFETs much

it is fairly easy to go much further down than this!
With 2x 1N270, or better AA119 type germanium diodes and CA3140E
OP-amp you can measure down below -46dBm up to at least 600MHz.

I made a correction amplifier using several 1N4148 for each range, but
today, I would have tried a CA3140E buffer, with a possible log.amp
and connect this to a datalogger, which may be calibrated for every
10dB range, with some possible frequency calibration (like the one you

have on SHF power meters). With this circuit you might measure below
-40dBm on 1,296GHz, and still have useful sensitivity above 2.320 GHz.
But you have to calibrate the circuit yourself. This is accomplished
by borrowing a signal generator from work or from a friend (most SHF
friends have some sort of reliable signal generators)

From: tait@primeline.net (Gary Tait)
Subject: Antenna rotator control box schematic needed.

I am looking for plans for a tv antenna rotator. It is one of the ones that
the antenna mast goes through. It is a 4 wire, with the wires connected
internally as follows:

1: Black, Motor common
2:Yellow , motor, switch NO
3:red , motor,switch NC
4:blue , switch common through 27 Ohm 5W Resistor.

The switch opens/closes about 30+ times per revolution of the mast.

I would like to build an electronic control box using discrete TTL chips if
possible.

the ceramic resonnators are fine for oscillators, and they may be
pulled more than comparative xtals. I am sure you may use them for
filters, I have seen a BP-filter for 7MHz band using such devices

I posted some info on a newsgroup some times, but obviously this
attracted little interest or nobody makes any experiments any more?
I have made experiments with oscillators using ceramic resonators for
250, 480, 960kHz, and 3,58, 4.0 MHz
it is easy to pull a 3.58MHz element to cover 3.5-3,6MHz in a VFO
An oscillators using ceramic resonnators should have some 3 times
higher capacitor values than xtal oscillators to operate
satisfactorily

From: k3ky@juno.COM (David E Sinclair)
Subject: Cheap/decent 12V supply?

Using the 12V supply only from a 5V/12V computer supply probably would not
work well for charging a 12V lead/acid car battery. More voltage is needed. If
the two supplies in the computer unit are not ground referenced, then they
could be series-connected for 17V. Some simple circuitry could be used to
control or limit the battery charge current. There are several approaches
such as constant voltage, constant current, taper charging, etc. I will be glad
to supply references/schematics, etc. on request. Some other writers have
pointed out correctly that a linear supply would be a better choice than a
noisy computer switching supply, and that one or both supplies in the switch-
ing unit may have a minimum current requirement. That can be easily met with
various types of loads added in parallel with the supply needing it.

For RF prototyping where I used to work, they used little single-sided PCBs about 1" square, with adhesive backing, with a surface mount pattern for a single chip brought out to wider pads. These were positioned on the Cu side of a piece of PCB laminate and the circuit wired up directly on the Cu ground plane with wire-wrap wire or self-fluxing magnet wire. I'll ask someone there where they got the things from. They were very cheaply made, and were free issue in the lab. I should have liberated a few before I left. 8-(

DC has no skin effect, which is important even at 50 Hz for very large currents. DC has no radiation losses, which is also significant at 50 Hz over long distances. For a given RMS, DC has a 30% smaller peak current and peak voltage. DC has no capacitively coupled current loss (not the same as leakage current) therefore power factor loss, through the insulation into the salt water. This capacitive current can cause electrolysis effects.

Subject: power transmission (electric)

Hi,
I've been an engineer (manager) in the undersea cable business for 30 years and know of only a few DC cable projects for very specific applications. DC would not be an effective way to transmit power. High voltage pluse cables for digital transmission (very low current) are the only cables I know fit your discription. These are not power cables. Undersea power transmission are larger cables and are usually 5,15,35,64,130kv cables having conductors with thousands of circular mils and range from 4" to 8" diameters. There are some even larger. Cables usually contain 3 or 4 main conductors and are operated in a three phase (balanced) configuration. Today, many undersea power cables contain optical light guides (fiber optics) for signal transmission. Corona is normally controlled by proper shielding and the use of semi-con materials. External damage is the major cable failure although the we still like to get excited over the effects of "treeing" (crack propagation within a dielectric due to electro stress). If you would like any more details on cable or cable useage, drop me an email. Oxford,William & Associates: Cable Systems Consultants. wjoxford@aol.com or N4MXF@aol.com. 73 Bill

>
> Comments here or remove the ! to reply via e-mail...73 all, Web Williams

Well, not quite! I have to argue against two of your points or
suggestions.
The cyanide is NOT just a cleaner. The silver ions bind to the
cyanide ions in a way leaving hardly any free silver ions in the plating
solution. (One book reports about 1 free silver ion per cubic
centimeter. That is a VERY small amount of silver. An ion is
esstentially just an atom.)
Why is that important? If there are many free ions and you stick
almost any metal into the solution the silver ions will pick up an
electron from the metal and become metallic silver while one of the
substrate ions will go into solution. This is the secret of
"electroless" plating. Sounds wonderful, but it is not; the metal
deposited this way is poorly bonded and can be often wiped off with a
rag. It is also porous. Metals going into solution include copper,
zinc, iron, practically anything except gold and platinum!
The other objection is rubbing silver onto a hot surface. Actually,
it probably could be made to work, if you are good and work fast. The
problem is that the melting point of silver is lower than the melting
point of copper (probably higher than for brass), but not a lot lower (a
bit over 100 degrees C.) You are at risk of melting the copper if you
heat with a tourch. It would work better with a silver bath (want to
melt a liter of silver in the kitchen?) with good temperature control.
There is another problem; the silver and copper rapidly alloy to form
a lower melting point alloy. If you do not work fast this process can
cause holes to develop as the alloy forms ever deeper into the
substrate. This is something you will understand better if you ever did
soldering on fine copper wire with lead-tin solder. The wire disappears
if you are too slow. The silver/copper process will be faster. You will
get a great bond, if you are good enough.

Bob

Subject: VCO, paralelling varactors

FRANK,

I guess I was not as clear as I should have been.

1 varactor VCO ( MV109)
case 1: CFIXED = 100 PF
CVARACTOR= 2-20PF
CTOTAL= 102-120 PF
Cmax/cmin= 1.176
FreqMax/FreqMin= SQRT(1.176)= 1.085 or 8.5%

2 paralell Varactor VCO( 2*MV 109)
case 2: CFIXED = 100 PF
CVARACTOR= 4-40PF : 2 varactors in parallel
CTOTAL= 104 to 140 PF
Cmax/Cmin= 140/104= 1.346

----------------------------------
FreqMax/FreqMin= SQRT(1.346)= 1.16= 16%

Thus the max to min capacity should change.

But I could not detect the change in frequency coverage
after adding the second varactor.
(Maybe I made an error in my experiment.)

I guess that my question was, is the maximum capacity really
going to double when you paralell another varactor across the
varactor of a VCO. I am specificall talking about (1 varactor

VCO) and NOT the 2 back-to-back varactor VCO.

I dont really know, but, I think that the one varactor VCO
drives the varactors in a highly non-linear way.There will be 5-10
volts RF/AC across the varactor, and 1-10 volts DC to tune it.
Thus, I believe that varactor will be working in a highly nonlinear
way. Also, Q is rather low for these types of varactors.

Anyway, I try this varactor paralleling again, and hopefully I had
done something wrong earlier, and paralelling varactors really
does increase their max capacity in case of a VCO.

Thanks for your thoughts.

MAYBE. Each device (tube, FET, MOSFET, BJT) has a diffrent set of
parameters. Even each type of tube(6J6, 6AK5, 6DJ8) differs as
to G-P, G-C, C-P capacitances, and their transconductance.

I guess the key is to design around the limitations of the device
that we are using.

These limitations are not very difficult to design around for FETs.
MPF102 is not a very good FET for RF usage. Though it
is still usable.
You can use a dual gate MOSFET like 40673 3SK174 etc,
but their is not likely to be a lot of difference between that
and a properly designed circuit using J-310.
( J-310 is a good device for general RF usage, much better than
MPF-102).

I guess the key is balance.

1.Just enough RF gain to give you a good noise figure with the antenna
and frequency you intend to use it with. Too much gain and you may
compromise the cross modulation performance. If your front end(mixer)
is sensitive enough, you might not need any RF gain atall.

2. Impedance matching. This cannot be stressed enough.
In fact they say that the key to SUCCESSFUL RF design is
impedance matching!
1.Match antenna impedance to input tuned circuit. If you have a
large antenna, use a 1 turn link to couple the antenna.
If all you have is a 6 feet whip as an antenna, connect it to the
top or the hot end of the antenna.
2. Match source impedance to input tank. Generally 2 turns should
be all that is needed.
3. Match drain impedance to output tank. Around 50% or should be good.

3. Adjust input and output loading.More loading means less circuit Q
whcih might help in adjusting BAND coverage and tracking between
input and output circuits.
Less loading will make tuning much more sharp and increase
circuit Q.
4. Having adjusted loading , you might want to go to Step 2 to fine
tune the impedance matching, though it should not be really
neccessary.

5. If you still have problems with crossmodulation, run the FET
as HOT as possible, i.e. with as much drain current as possible.
I guess around 20 mA or so.
It was stated somewhere that even a BJT can have very good
crossmodulation performance better than a dual gate MOSFET
by running it at about 20-50 mA or so.
Device linearity is greatly increased and crossmodulation reduced
by running the device hot enough.

6. Use of pads can improve cross modulation performace.
This is suggested if you have a large antenna.

7. Also, it might be good idea to bear in mind that the
Cross MOD performace of the mixer should be high enough
for you to use a RF pre amp.
DONT even think about using an preamp with a NE602 mizer front end
or general coverage portable SW radios receievers. Just use
a passive 1-2 tuned circuit filters . A lot of performance gain
can be acheived just by proper impedance matching and NO FET
rf amp.
Please think about the NO FET(or tube or transistor) RF amp also!
It produces RF gain by proper impedance matching.

Subject: measuring VVC-diodes, how?

Hi
I need to calibrate capacitance diodes to voltage to use them in a
2-50MHz impedance meter. I believe it may not be a good idea to
measure the capacity using a C-meter, since signal voltage level may
be much higher than the actual dc voltage used.
I have a Radiometer Q-meter, but I would prefer an easier way than
measuring the influence on a tuned circuit.
Any better suggestions? What does manufacturers use?

>>of equipment is used to transform from AC to DC and DC to AC?
>>Could it be power factor?
>>73 and TIA
>
>The main reason is that DC is subject to only the resistance losses in the conductors. The line inductance and capacitance does not cause reactive voltage drop is a DC transmission line. In an AC line these losses are serious and must be corrected wth very expensive capacitor banks.

The reason that DC is not often used is that the cost of the high voltage solid state conversion systems have been very expensive in the past. Recently these cost have dropped and more DC transmission lines are being considered and will be built.

The merits of DC vs AC power generation,transmission, and distribution were highly debated at the turn of the century by Edison (DC) and Tesla (AC). Tesla eventually won the debate, but with the changes in technology of the next century, Edison and DC may be exonerated.

Either the phasing or "Weaver" techniques can be used to build a simple "single signal" receiver and a SSB transmitter, too ... it is possible to obtain substantial undesired sideband suppression without too much difficulty ... especially with DSP techniques ...

Hi all,

The principle problem with the responses to this topic is that
amateurs employ what is called "pre-amps". Much of what follows this
presumption is correct, but inappropriate to SWL (due to the presumed
application of the "pre-amp").

Modestly priced receivers often used by SWL'ers do NOT need wideband
amplification, and their receivers are not atmospheric noise limited.
As already identified, filtering pays off and post-amplification would
return the filter's loss with perhaps some overall gain improvement.
The term for such a device is Pre-selector. Hams having been for

---
years passive in construction practices have allowed commercial
vendors to dominate design issues by virtue of offering "features."

A good receiver has front end tuning, often several tuned RF stages
prior to the first mixer. These stages are rare in current designs
having been consigned to the dust-bin by marketing department design
choices. Simply put they view that the Ham would rather have his hand
wither than reach for a "tuning" knob. That it isn't built into the
VFO knob is again a marketing issue in that cost issues arrise.
Tracking and alignment problems abound requiring the parts count to
push against the profit margin.

I have three friends with front-end overload problems from a nearyby
AM commercial station. Their rigs are top of line Kenwoods and they
suffer the same as my lowly DX-440 which cost an eighth of their
price. Both the DX-440 and these Kenwoods suffer the same design
shortfall: wide open front ends (OK so they are Band filtered, they
suffer all the same!). Pre-selectors would solve the problems all
around, but I already know my friends would shudder to have to reach

for a second knob (much less tuner). They conform to the expectations of Marketeers and their purchases have validated the entropy of design.

SWL'ers look for construction projects for Pre-selectors or tuned pre-amps. This is the single greatest improvement you can make outside of building IF ancillaries such as Q-multipliers, crystal lattice filters, or another stage of mixing to a lower, narrower IF. Also, do not neglect the Tuner as the cheapest means to reject noise and interfering stations. Sophisticated tuning networks with reject notches also keep cost low. Much of this material was present in the ARRL Handbooks of the '60's. I hope these common engineering issues haven't become folk-lore through neglect.

Not much, if there are a lots of different pagers in different
frequencies.

A good choice might be a sharp bandpass filter--the bigger the
better. One the size of a loaf of bread might do the trick, though
people have made them out of 20 gallon garbage cans... Zack W1VT

Frank, tell us a bit about what you're trying to accomplish, maybe we can
suggest alternate approaches using more common parts.

>>
>>Why do power companies use DC to transmitt power. 400KV, 500MW. What
kind
>>of equipment is used to transform from AC to DC and DC to AC?
>>Could it be power factor?
>>73 and TIA
>
>The main reason is that DC is subject to only the resistance losses in

the conductors. The line inductance and capacitance does not cause reactive voltage drop is a DC transmission line. In an AC line these losses are serious and must be corrected wth very expensive capacitor banks.

The reason that DC is not often used is that the cost of the high voltage solid state conversion systems have been very expensive in the past. Recently these cost have dropped and more DC transmission lines are being considered and will be built.

The merits of DC vs AC power generation,transmission, and distribution were highly debated at the turn of the century by Edison (DC) and Tesla (AC). Tesla eventually won the debate, but with the changes in technology of the next century, Edison and DC may be exonerated.

Either the phasing or "Weaver" techniques can be used to build a simple "single signal" receiver and a SSB transmitter, too ... it is possible to obtain substantial undesired sideband suppression without too much difficulty ... especially with DSP techniques ...

Hi all,

The principle problem with the responses to this topic is that
amateurs employ what is called "pre-amps". Much of what follows this
presumption is correct, but inappropriate to SWL (due to the presumed
application of the "pre-amp").

Modestly priced receivers often used by SWL'ers do NOT need wideband
amplification, and their receivers are not atmospheric noise limited.
As already identified, filtering pays off and post-amplification would
return the filter's loss with perhaps some overall gain improvement.
The term for such a device is Pre-selector. Hams having been for

---
years passive in construction practices have allowed commercial
vendors to dominate design issues by virtue of offering "features."

A good receiver has front end tuning, often several tuned RF stages
prior to the first mixer. These stages are rare in current designs
having been consigned to the dust-bin by marketing department design
choices. Simply put they view that the Ham would rather have his hand
wither than reach for a "tuning" knob. That it isn't built into the
VFO knob is again a marketing issue in that cost issues arrise.
Tracking and alignment problems abound requiring the parts count to
push against the profit margin.

I have three friends with front-end overload problems from a nearyby
AM commercial station. Their rigs are top of line Kenwoods and they
suffer the same as my lowly DX-440 which cost an eighth of their
price. Both the DX-440 and these Kenwoods suffer the same design
shortfall: wide open front ends (OK so they are Band filtered, they
suffer all the same!). Pre-selectors would solve the problems all
around, but I already know my friends would shudder to have to reach
for a second knob (much less tuner). They conform to the expectations
of Marketeers and their purchases have validated the entropy of
design.

SWL'ers look for construction projects for Pre-selectors or tuned
pre-amps. This is the single greatest improvement you can make
outside of building IF ancillaries such as Q-multipliers, crystal
lattice filters, or another stage of mixing to a lower, narrower IF.
Also, do not neglect the Tuner as the cheapest means to reject noise
and interfering stations. Sophisticated tuning networks with reject
notches also keep cost low. Much of this material was present in the
ARRL Handbooks of the '60's. I hope these common engineering issues
haven't become folk-lore through neglect.

>way. Also, Q is rather low for these types of varactors.

Sounds like the conditions are similar to the parametric amplifier or
varactor tripler :-).

If the high RF voltage across the varactor is your problem, then why
not use a varactor with large maximum capacitance (a tuning range from
,say, 25 pF to 250 pF) in series with a small (say 100 pF) fixed
capacitor. The two capacitances will form a capacitive voltage
divider, at the minimum capacitance the AC voltage across the varactor
is only slightly reduced but at maximum capacitance only a very small
fraction of the RF voltage is across the varactor (2/7 in this case).
This greatly reduces the risk for forward biasing at low tuning
voltages.

Your problem seem to be the large parallel capacitance, so it is quite
unrealistic to expect to get any large tuning range with varactors
with low maximum capacitance. With values in my example, you would get
sqrt ( (100+71)pF/(100+20)pF ) = 1.19 or 19 %. Using a larger series
capacitance would make the tuning range even larger, but it would also
increase the RF voltage across the varactor.

From: "P. Singh" <singhpk@NOSPAM.exit109.com>
Subject: VCO , paralleling Varactors

Does anybody know why paralelling another varactor across
the varactor of a LC Voltage controlled oscilator not increase
the tuning range of the VCO?

Both the varactors are reverse biased by the tuning voltage,
as varactors should be. So, connecting another varactor
across the LC tank circuit of a VCO should increase the freq
range of the VCO by 50% or so. It only does so by 1-5%. WHY?

They AC voltage across the tank circuit is going to be about 10 volts
or so. The DC bias voltage for the varactor is about 1-10 volts or so.
So, is it that the varactor is working in a totally nonlinear way?

Will connecting two varactors back-to-back and then paralelling
work. Or they still might be operating in a non linear way?

Does any body have any experience with paralelling single varactors
across the LC tank circuit of VCO.

ANy insight / help is greatly appreciated.

Thanks

Hi--

If you can't get a 479, try a 2SC3133. Good for 15W PEP.

You might try NTE for a direct substitute? They have a searchable table
for all kinds of semiconductors at http://www.nte.com/

> (snip)

Maybe you should have a look at a more recent issue? My latest
copy (1996) discusses regens as primarily a historical thing, but
considers direct conversion receivers to be an effective way of
receiving signals.

I can think of a number of important designs between 1988 and 1996
that would have changed the perception of DC receivers as cute toys,
but not serious receivers...

As always, you get what you pay for. An extremely simple receiver
will get the job done under some circumstances, but may not
hold up under extreme conditions.

Subject: Value of Dow-Key relay?

Dow key relays can be used for much more than switching from transmit to
receive in boatanchors. Some uses are:

switching between 2 antennas
switching in/out a preamplifier at the antenna
switching transverters to a common IF
switching rigs to a SWR meter

and many more.

<snip>

Perhaps the problem with paralleling two varactors is that the two diodes is not matched, resulting in more current flowing in one of the diodes.
Try using two resistors (and RFCs), to separate the bias voltages, and use two (relatively) large capacitors in series with the HF path. I'm too lazy to try to draw it in ascii, but I hope you get the idea.

I haven't actually tested this, it is just a guess.

Please post your results, if you try it out.

Do you have web access? Analog Devices home page has a search engine at
the opening screen. I entered AD737 and got it. They're www.analog.com.

I've used the 737 in a signal measuring setup before, and it's a pretty
good chip. There are easier ways (i.e., more ham like). Pretty sure that
Solid State Design for the Radio Amateur covers these if you'd rather.
They involve using differential hot carrier diodes driving an op amp,
with perhaps some bias to get down to the -20 dBm level.

73,
Bob

Subject: 11volts from 12 volts...

Hi bill,

Almost every 12 volt supply I have built using a 3 terminal
fixed regulator puts out about 11.5 volts or so. It seems
that the 12 volt regulators are manufactured with WIDE
tolerances.

Just use a diode or two in the ground lead of your 3 terminal reg
to increase output 11 volts to 12 volts or so.

D1, D2= In4001
C1= 10uf/16volts electrolytic

These cheap switching power supplies are terrible choices for radio use,
far too noisy. Best is battery ONLY...a decent 12V Lead Acid car battery
used AS-IS (sans charger) then when you switch OFF your set up...you
turn ON the charger.
Simple, Cheap, loads of current and, best of all, quiet.
friend,
Lute

The trick in soldering is to abandon the traditional soldering iron ...
get solder paste with "no-clean" flux (from ESP, for example ...
(800) 338-4353) and do reflow soldering with a source of hot air
(a heat gun will work in a pinch, if you keep your distance and are
careful) ...

SMT is NOT impossible, or even difficult, to work with ... IF you
take the effort to learn some new techniques ... however, this seems
to be a MAJOR problem for far too many hams ... far too few seem
willing to learn anything, let alone something modern ...

make an oven than a TCXO. A peltier heater is unnecessary as the crystal
will hace a minimum temperature coefficient above 27C
Your crystal will be an AT (lazy Z) cut optimised for minimum deviation
over the whole band. If you temperature control just the crystal it
should be possible to raise the temperature by using a servo heater to
where the crystal reaches its minimum frequencey with luck and if the
crystal is correctly cut this will be about 35C.
The Maintaining circuit will still be sensitive to temperature and will
limit any crystal only control to +-0.5ppm or so.

Subject: Need plans Alliance U100 Rotator control box.

I have what I have been told is an Alliance U-100 Rotator, I need a control box for, but don't wish to shell out the bucks for one.

Does anybody have plans for a solid state box, I could build out of TTL or cmos gates (other than the motor control circuitry of course.)

From: "Jeff W. Hockert" <hockerj@ece.orst.edu>
Subject: 2 meter antenna

I've just finished building a variation on this sleeve antenna which seems to work OK. I need to borrow a VHF SWR bridge and trim it yet, and then I can compare it to the J-Pole I've been using. My question is, should the two sides of the dipole be shorted together?

My antenna is constructed with 1/2 wavelength of copper 3/4" pipe over the feeding coax, with the braid shorted to the pipe at the midpoint of the antenna. The other half the dipole is base loaded to be electrically 3/4 wavelength long and physically 5/8 wavelength (I used a section of 1/8" steel rod with the coil making up the remainder of the length... I used a piece of solid phenolic plastic rod that plugs the end of the copper pipe and extends up as the coil form, and drilled out the center of the rod to set the steel element in). I am currently feeding the base of the loading coil with the coax center conductor, and do NOT have the two halves shorted... is this correct?

TIA,
Jason, N7IME

Hi Dave

I've done quite a bit of work with SM packages in my microwave work. There is no real problems, any more than with other type, the R's and C's take a bit of geting used to (they fly round the shack really well if you get the mounting wrong!), but it just requires new skills to be learnt, but certainly not difficult or impossible for Mr Average Ham.

On a tangential issue, has anyone done much hobby work with the new SOT gull-wing or even surface mount packages? The "pin" spacing on some of these is getting awfully small. I've gotten a few samples of some nice IC's I's like to evaluate, but etching and soldering at those line widths makes me wonder if at some point the amateur homebrewer is going to get scraped off.

> this (Too much gain? Why would the lead length matter?)

The lead length doesn't matter so much as the circuit's design. The problem with that circuit is that it's inherently unstable when its input and output are tuned. (Grounding a JFET's gate doesn't shield O from I as grounding a vacuum tube's grid can do.) The MPF102 isn't a very gainy JFET, so if you tap the I/O tuned circuits down far enough and/or stagger the I/O circuits' tuning, *and* there's sufficient loading at I and/or O, the circuit may not oscillate.

That circuit also disserves you by getting much less selectivity out of two tuned circuits than can easily be achieved with them.

A better approach is to close that book and use a circuit engineered for predictable gain and stability. One recommendation is the single-40673 amplifier described by Wes Hayward, W7ZOI, in November 1981 *QST*'s "Progressive Communications Receiver," later carried in many subsequent ARRL *Handbook*s under the title "High-Performance Communications Receiver" (it's in the 1992 edition, for instance). (Yes, 40673s are now "new old stock," but you can also use an ECG222, NTE222, MPF131, 3N187 and 3SK [Japanese] or BF [European] equivalents. Dual-gate MOSFETs may be passe over in the US, but in Japan and Europe they're still very much viable. The Japanese in particular have taken receive-class JFETs and MOSFETs much

further than manufacturers here; even the [old] 2SK125, for instance, is
much better than the best [J310/U310] generally available here.)

When you combine Hayward's amplifier with the appropriate
double-tuned-circuit output filter (described in the same article that
describes the amplifier), you'll have good, predictable gain (10 dB) *and*
the selectivity you need. Wes's circuit isn't the only possible solution
to your problem, of course, but it has withstood the tests of time and use
that the other circuit hasn't.

Hi Myles
You might want to check out "Elmers" at pw2.netcom.com/~ac6v/pageas.html

Also, one of the local radio stores should have some type of literature
from the Canadian or Ametuer Radio Relay Leagues. They should be able to
provide you some contacts.

# 2142. RE: Extend frg on ICOM IC 737

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-25 00:00:00 UTC
From: clint.bradford@atdbbs.com
Message-ID: <9708242138177681@atdbbs.com>
Source record: 91416

Following is a copy from Packet, on how to do the transmit mod for the well-reviewed. Icom 737 HF transciever. If someone else tries it, please let us know if it works.

73 from Leigh/KM6JE in Santa Barbara.

---

1300 B# 1312 ALL IW3BKW WW 940312 ICOM IC-737 GEN.COVERANGE.
From: IW3BKW@OE7XCI.#TIR.AUT.EU
ICOM IC-737
---
GENERAL COVERANGE IN TRANSMISSION.

1) Remove the top and bottom covers of the transceiver.

2) Remove the final power amplifier module.

3) Locate the LOGIC-UNIT on witch there is a back-up lithium battery for the RAM memory.

4) On the LOGIC-UNIT, near the chip called IC6 (TMP82C265BF-2),between the output pin PC06 and the imput pin PA15, find the diode D3.

5) This diode is not an SMD component.

6) Cut the diode D3.

..Now the ICOM IC-737 will transmit from 1,6 to 30 Mhz !!!.

CW Filter Switching Modification for the Icom 737

The Icom 737 is a wonderful radio for CW operation, but I did not like the filtering switching options offered in normal operation of the radio when you have installed BOTH the 9 Mhz and 455 Khz optional CW filters. The default option is to use the SSB filter for CW in the CW mode, and then switch in BOTH the 9 Mhz and 455 Khz optional IF filters in the CW-N mode. This provides too broad a filter for general tuning in CW, and the CW-N mode (with the two filters in) is far too sharp for just tuning around.

I felt that it would be better to allow the 455 Khz filter to be functioning full time in the CW mode, and then switch in the 9 Mhz CW filter in the CW-N mode. The following simple modification only requires a single wire to added to the radio.

MODIFICATION

1) Remove the top/bottom cover of the radio as per the manual.

2) Position the radio facing you and locate the resistor R-323 which is simply labeled "323" on the PC board just to the left of the opional 455 Khz CW filter. Solder a wire to the end of R-323 which is closest to the front pannel.

3) Locate J-3 just above and to the right of the 9 Mhz filter F-13. Attach a wire to the connector or wire going to pin 7. Pin 7 is the third pin from the right. (The pins are numbered 1-9 from left to right) You may carefully tack solder a wire to the plug by removing it first. I used a solid 28 gauge wire and just pushed it into the connector without soldering.

4) Replace the top and bottom covers.

I'm happy with the function of this modified switching arrangement. The CW-N function is now the mode of last resort when going after the weak ones, or when the QRM gets out of control, and tuning with just the 455 Khz filter is a better than using the SSB filter.

Good luck! 73's
Greg Chartrand

> That circuit also disserves you by getting much less selectivity out of two
> tuned circuits than can easily be achieved with them.
>
> A better approach is to close that book and use a circuit engineered for
> predictable gain and stability. One recommendation is the >single-40673

MAYBE. Each device (tube, FET, MOSFET, BJT) has a diffrent set of
parameters. Even each type of tube(6J6, 6AK5, 6DJ8) differs as
to G-P, G-C, C-P capacitances, and their transconductance.

I guess the key is to design around the limitations of the device
that we are using.

These limitations are not very difficult to design around for FETs.
MPF102 is not a very good FET for RF usage. Though it
is still usable.
You can use a dual gate MOSFET like 40673 3SK174 etc,
but their is not likely to be a lot of difference between that
and a properly designed circuit using J-310.
( J-310 is a good device for general RF usage, much better than
MPF-102).

I guess the key is balance.

1.Just enough RF gain to give you a good noise figure with the antenna
and frequency you intend to use it with. Too much gain and you may
compromise the cross modulation performance. If your front end(mixer)
is sensitive enough, you might not need any RF gain atall.

2. Impedance matching. This cannot be stressed enough.
In fact they say that the key to SUCCESSFUL RF design is
impedance matching!
1.Match antenna impedance to input tuned circuit. If you have a
large antenna, use a 1 turn link to couple the antenna.
If all you have is a 6 feet whip as an antenna, connect it to the
top or the hot end of the antenna.
2. Match source impedance to input tank. Generally 2 turns should
be all that is needed.
3. Match drain impedance to output tank. Around 50% or should be good.

3. Adjust input and output loading.More loading means less circuit Q
whcih might help in adjusting BAND coverage and tracking between
input and output circuits.
Less loading will make tuning much more sharp and increase
circuit Q.
4. Having adjusted loading , you might want to go to Step 2 to fine
tune the impedance matching, though it should not be really
neccessary.

5. If you still have problems with crossmodulation, run the FET
as HOT as possible, i.e. with as much drain current as possible.
I guess around 20 mA or so.
It was stated somewhere that even a BJT can have very good
crossmodulation performance better than a dual gate MOSFET
by running it at about 20-50 mA or so.
Device linearity is greatly increased and crossmodulation reduced
by running the device hot enough.

6. Use of pads can improve cross modulation performace.
This is suggested if you have a large antenna.

7. Also, it might be good idea to bear in mind that the
Cross MOD performace of the mixer should be high enough
for you to use a RF pre amp.
DONT even think about using an preamp with a NE602 mizer front end
or general coverage portable SW radios receievers. Just use
a passive 1-2 tuned circuit filters . A lot of performance gain
can be acheived just by proper impedance matching and NO FET
rf amp.
Please think about the NO FET(or tube or transistor) RF amp also!
It produces RF gain by proper impedance matching.

From: la8ak@online.no (J M Noeding)
Subject: measuring VVC-diodes, how?

Hi
I need to calibrate capacitance diodes to voltage to use them in a
2-50MHz impedance meter. I believe it may not be a good idea to
measure the capacity using a C-meter, since signal voltage level may
be much higher than the actual dc voltage used.
I have a Radiometer Q-meter, but I would prefer an easier way than
measuring the influence on a tuned circuit.
Any better suggestions? What does manufacturers use?

Not much, if there are a lots of different pagers in different
frequencies.

A good choice might be a sharp bandpass filter--the bigger the
better. One the size of a loaf of bread might do the trick, though
people have made them out of 20 gallon garbage cans... Zack W1VT

Frank, tell us a bit about what you're trying to accomplish, maybe we can suggest alternate approaches using more common parts.

>>of equipment is used to transform from AC to DC and DC to AC?
>>Could it be power factor?
>>73 and TIA
>
>The main reason is that DC is subject to only the resistance losses in the conductors. The line inductance and capacitance does not cause reactive voltage drop is a DC transmission line. In an AC line these losses are serious and must be corrected wth very expensive capacitor banks.

The reason that DC is not often used is that the cost of the high voltage solid state conversion systems have been very expensive in the past. Recently these cost have dropped and more DC transmission lines are being considered and will be built.

The merits of DC vs AC power generation,transmission, and distribution were highly debated at the turn of the century by Edison (DC) and Tesla (AC). Tesla eventually won the debate, but with the changes in technology of the next century, Edison and DC may be exonerated.

Either the phasing or "Weaver" techniques can be used to build a simple "single signal" receiver and a SSB transmitter, too ... it is possible to obtain substantial undesired sideband suppression without too much difficulty ... especially with DSP techniques ...

Hi all,

The principle problem with the responses to this topic is that
amateurs employ what is called "pre-amps". Much of what follows this
presumption is correct, but inappropriate to SWL (due to the presumed
application of the "pre-amp").

Modestly priced receivers often used by SWL'ers do NOT need wideband
amplification, and their receivers are not atmospheric noise limited.
As already identified, filtering pays off and post-amplification would
return the filter's loss with perhaps some overall gain improvement.
The term for such a device is Pre-selector. Hams having been for

---
years passive in construction practices have allowed commercial
vendors to dominate design issues by virtue of offering "features."

A good receiver has front end tuning, often several tuned RF stages
prior to the first mixer. These stages are rare in current designs
having been consigned to the dust-bin by marketing department design
choices. Simply put they view that the Ham would rather have his hand
wither than reach for a "tuning" knob. That it isn't built into the
VFO knob is again a marketing issue in that cost issues arrise.
Tracking and alignment problems abound requiring the parts count to
push against the profit margin.

I have three friends with front-end overload problems from a nearyby
AM commercial station. Their rigs are top of line Kenwoods and they
suffer the same as my lowly DX-440 which cost an eighth of their
price. Both the DX-440 and these Kenwoods suffer the same design
shortfall: wide open front ends (OK so they are Band filtered, they
suffer all the same!). Pre-selectors would solve the problems all
around, but I already know my friends would shudder to have to reach

for a second knob (much less tuner). They conform to the expectations of Marketeers and their purchases have validated the entropy of design.

SWL'ers look for construction projects for Pre-selectors or tuned pre-amps. This is the single greatest improvement you can make outside of building IF ancillaries such as Q-multipliers, crystal lattice filters, or another stage of mixing to a lower, narrower IF. Also, do not neglect the Tuner as the cheapest means to reject noise and interfering stations. Sophisticated tuning networks with reject notches also keep cost low. Much of this material was present in the ARRL Handbooks of the '60's. I hope these common engineering issues haven't become folk-lore through neglect.

Subject: 11volts from 12 volts...

Hi bill,

Almost every 12 volt supply I have built using a 3 terminal
fixed regulator puts out about 11.5 volts or so. It seems
that the 12 volt regulators are manufactured with WIDE
tolerances.

Just use a diode or two in the ground lead of your 3 terminal reg
to increase output 11 volts to 12 volts or so.

D1, D2= In4001
C1= 10uf/16volts electrolytic

D2

Subject: Cheap/decent 12V supply?

These cheap switching power supplies are terrible choices for radio use,
far too noisy. Best is battery ONLY...a decent 12V Lead Acid car battery
used AS-IS (sans charger) then when you switch OFF your set up...you
turn ON the charger.
Simple, Cheap, loads of current and, best of all, quiet.
friend,
Lute

Well, really it was George Westinghouse who fronted the bills for
Edison's "AC is to dangerous to use" campaign. Edison fought as dirty
as he could. He arranged for NY state to receive a Westinghouse
Alternator which was used the first electrocution, a rather botched
affair. Edison had gone around NY state county fairs showing AC was
lethal by dispatching farm animals with an alternator. The critical
event that decided the issue was the award of the power plant at
Niagara Falls to the AC system. The issue turned on distribution and
AC clearly had the advantage there. I believe--but am not sure--that
a 25 Hz system is still in use at the falls.

you are right.

Can I ask how RFI does a ordinary superhet radiate? After all, the
superhet has 1-5 oscilators going.

HOW much RFI does a typical computer radiate? It radiates enough
RFI to generate S-9 noise on all HF bands.

HOW much RFI does a TV set radiate? Enough to blank out the LF bands
below 500 KHZ.

So, RFI generated by a regen receiver is like the least of the
problems today.

YES, the RFI radited by regen RX can be reduced by proper design.
1. Operate the regen at very low poer levels( microwatts)
2. Use a loosely coupled antenna.

The use of RF amp to isolate the regen from the antenna is not
recommended because:-
1. It worsens the overload and cross-modulation problem.
2. Does not provide a lot more isolation than a loosely couple antenna
can provide.
3. RF amp degrades the noise performance of the regen RX.
My regen is a lot more sensitive than my superhet RX SONY
ICF 2001. In fact I use the regen as a regenerative antenna
amplifier/ Q multiplier at the signal frequency for the SUPERHET.

COLLINS now a part of ROCKWELL(military contractor) has a DC
reciever using DSP techniques as its top product. This DSP/DC
reciever can recieve AM,FSK among all the usual SSB, CW etc.
I believe if collins thinks that the DC/DSP reciever is the way
to GO for military technology, that really may be the way to
go for the future.

I still have to get my R2 reciever running.
I guess I will. someday.

They problem, as far as I am concerned with DC recievers, is the
90 degrees phase shifted I-Q VFO signals needed.

I think that a R2 driven by a DDS VFO may be the best bet.

May be ,all the I-Q filtering/signal done in OPAMPS in the R2
should probably be done by a motorola DSP 56000.
(Does any one know where to buy a motorola DSP 56000 devlopment kit?)

>I'm not
> sure if all designers/experimenters agree, and, besides the purpose of

> the use of certain techniques.
> Though most comments in the book are accurate (and helpful), I

YES, It is not just the negative tone, it is the very casual and
less than a good engineering approach of the handbook which does
more harm than good.
Advances in radio engineering are still possible and happening
today. But they are more or less happening in the corporations etc.

( All the information about (ROCKWELL COLLINS) was taken from their
web-page as I remember it. So, look at their web page for more
information)

From: "John M. Franke" <j.m.franke@larc.nasa.gov>
Subject: VCO , paralleling Varactors

What is important is the maximum to minimum capacitance ratio of the
varactor. If the maximum capacitance is 100 pF and the minimum is 10
pF, the ratio is of course 100/10 = 10. Paralleling two varactors
produces a new ratio of 200/20 = 10, no change. Since the resonant
frequency is equal to 1 divided by 2 pi times the square root of L times
C, the change in frequency is proportional to 1 over the square root of
the change in the LC product. In this case the frequency range is the
square root of 10. One way to help see this is to insert values into

the equation and see what happens. Pick an inductor, calculate the
minimum and maximum frequency for the minimum and maximum capacitance
with one varactor. Then repeat for two.
Does this help?
John

> resonant frequency? Can someone explain WHY this circuit is doing
> this (Too much gain? Why would the lead length matter?)

The lead length doesn't matter so much as the circuit's design. The
problem with that circuit is that it's inherently unstable when its input
and output are tuned. (Grounding a JFET's gate doesn't shield O from I as
grounding a vacuum tube's grid can do.) The MPF102 isn't a very gainy
JFET, so if you tap the I/O tuned circuits down far enough and/or stagger
the I/O circuits' tuning, *and* there's sufficient loading at I and/or O,
the circuit may not oscillate.

That circuit also disserves you by getting much less selectivity out of two
tuned circuits than can easily be achieved with them.

A better approach is to close that book and use a circuit engineered for
predictable gain and stability. One recommendation is the single-40673
amplifier described by Wes Hayward, W7ZOI, in November 1981 *QST*'s
"Progressive Communications Receiver," later carried in many subsequent
ARRL *Handbook*s under the title "High-Performance Communications Receiver"
(it's in the 1992 edition, for instance). (Yes, 40673s are now "new old
stock," but you can also use an ECG222, NTE222, MPF131, 3N187 and 3SK
[Japanese] or BF [European] equivalents. Dual-gate MOSFETs may be passe
over in the US, but in Japan and Europe they're still very much viable.
The Japanese in particular have taken receive-class JFETs and MOSFETs much

From: clint.bradford@atdbbs.com (Clint Bradford)
Subject: Extend frg on ICOM IC 737

Following is a copy from Packet, on how to do the transmit mod for the
well-reviewed. Icom 737 HF transciever. If someone else tries it, please
let us know if it works.

73 from Leigh/KM6JE in Santa Barbara.

---
1300 B# 1312 ALL IW3BKW WW 940312 ICOM IC-737 GEN.COVERANGE.
From: IW3BKW@OE7XCI.#TIR.AUT.EU
ICOM IC-737
-----------
GENERAL COVERANGE IN TRANSMISSION.

1) Remove the top and bottom covers of the transceiver.

2) Remove the final power amplifier module.

3) Locate the LOGIC-UNIT on witch there is a back-up lithium battery
for the RAM memory.

4) On the LOGIC-UNIT, near the chip called IC6 (TMP82C265BF-2),between
the output pin PC06 and the imput pin PA15, find the diode D3.

5) This diode is not an SMD component.

6) Cut the diode D3.

..Now the ICOM IC-737 will transmit from 1,6 to 30 Mhz !!!.

CW Filter Switching Modification for the Icom 737

The Icom 737 is a wonderful radio for CW operation, but I did not like the filtering switching options offered in normal operation of the radio when you have installed BOTH the 9 Mhz and 455 Khz optional CW filters. The default option is to use the SSB filter for CW in the CW mode, and then switch in BOTH the 9 Mhz and 455 Khz optional IF filters in the CW-N mode. This provides too broad a filter for general tuning in CW, and the CW-N mode (with the two filters in) is far too sharp for just tuning around.

I felt that it would be better to allow the 455 Khz filter to be functioning full time in the CW mode, and then switch in the 9 Mhz CW filter in the CW-N mode. The following simple modification only requires a single wire to added to the radio.

MODIFICATION

1) Remove the top/bottom cover of the radio as per the manual.

2) Position the radio facing you and locate the resistor R-323 which is simply labeled "323" on the PC board just to the left of the opional 455 Khz CW filter. Solder a wire to the end of R-323 which is closest to the front pannel.

3) Locate J-3 just above and to the right of the 9 Mhz filter F-13. Attach a wire to the connector or wire going to pin 7. Pin 7 is the third pin from the right. (The pins are numbered 1-9 from left to right) You may carefully tack solder a wire to the plug by removing it first. I used a solid 28 gauge wire and just pushed it into the connector without soldering.

4) Replace the top and bottom covers.

I'm happy with the function of this modified switching arrangement. The CW-N function is now the mode of last resort when going after the weak ones, or when the QRM gets out of control, and tuning with just the 455 Khz filter is a better than using the SSB filter.

Good luck! 73's
Greg Chartrand

The new Rockwell Collins 95S-1 (or something like that) covers
5 KHz to 2 GHz. It is called a "homodyne"; it is *essentially*
direct conversion. DSP processing for detection of just about
every mode and bandwidth imaginable. A very nice receiver....

Costs around $11K commercial, $6K GSA contract.

Subject: VCO , paralleling Varactors

Hi

THis was done succesfully in the Uniden President Jackson CB
radio.Looking at the schematic there are actually two pair of varactors
in addition to the main varactor used in the VCO circuit to extend the range.

The aux pairs are switched in by the channel selector at
a specific programming word.

Hope this helps...

Carl

further than manufacturers here; even the [old] 2SK125, for instance, is
much better than the best [J310/U310] generally available here.)

When you combine Hayward's amplifier with the appropriate
double-tuned-circuit output filter (described in the same article that
describes the amplifier), you'll have good, predictable gain (10 dB) *and*
the selectivity you need. Wes's circuit isn't the only possible solution
to your problem, of course, but it has withstood the tests of time and use
that the other circuit hasn't.

Subject: Sale: Philips BGY35Z (22W output) power modules for 132-156MHz

Dear Fellow Hams!
I have a few Philips power modules (BGY35Z) that should be used rather than
be sitting on
a shelf. BGY35Z is a special selection of BGY35, which has a higher
guaranteed output
power.

Input power is 300 mW and power supply is 12.5V.

I am offering these modules, which data sheet for $100 excluding freight
and handling.
These are unused parts.

Sounds like the conditions are similar to the parametric amplifier or
varactor tripler :-).

If the high RF voltage across the varactor is your problem, then why not use a varactor with large maximum capacitance (a tuning range from ,say, 25 pF to 250 pF) in series with a small (say 100 pF) fixed capacitor. The two capacitances will form a capacitive voltage divider, at the minimum capacitance the AC voltage across the varactor is only slightly reduced but at maximum capacitance only a very small fraction of the RF voltage is across the varactor (2/7 in this case). This greatly reduces the risk for forward biasing at low tuning voltages.

Your problem seem to be the large parallel capacitance, so it is quite unrealistic to expect to get any large tuning range with varactors with low maximum capacitance. With values in my example, you would get sqrt ( (100+71)pF/(100+20)pF ) = 1.19 or 19 %. Using a larger series capacitance would make the tuning range even larger, but it would also increase the RF voltage across the varactor.

From: "P. Singh" <singhpk@NOSPAM.exit109.com>
Subject: VCO , paralleling Varactors

Does anybody know why paralelling another varactor across
the varactor of a LC Voltage controlled oscilator not increase
the tuning range of the VCO?

Both the varactors are reverse biased by the tuning voltage,
as varactors should be. So, connecting another varactor
across the LC tank circuit of a VCO should increase the freq
range of the VCO by 50% or so. It only does so by 1-5%. WHY?

They AC voltage across the tank circuit is going to be about 10 volts
or so. The DC bias voltage for the varactor is about 1-10 volts or so.
So, is it that the varactor is working in a totally nonlinear way?

Will connecting two varactors back-to-back and then paralelling
work. Or they still might be operating in a non linear way?

Does any body have any experience with paralelling single varactors
across the LC tank circuit of VCO.

ANy insight / help is greatly appreciated.

Thanks

> (snip)

Maybe you should have a look at a more recent issue? My latest
copy (1996) discusses regens as primarily a historical thing, but
considers direct conversion receivers to be an effective way of
receiving signals.

I can think of a number of important designs between 1988 and 1996
that would have changed the perception of DC receivers as cute toys,
but not serious receivers...

As always, you get what you pay for. An extremely simple receiver
will get the job done under some circumstances, but may not
hold up under extreme conditions.

From: norman <norsan@bright.net>
Subject: Value of Dow-Key relay?

Dow key relays can be used for much more than switching from transmit to
receive in boatanchors. Some uses are:

switching between 2 antennas
switching in/out a preamplifier at the antenna
switching transverters to a common IF
switching rigs to a SWR meter

and many more.

<snip>

Perhaps the problem with paralleling two varactors is that the two diodes is not matched, resulting in more current flowing in one of the diodes.
Try using two resistors (and RFCs), to separate the bias voltages, and use two (relatively) large capacitors in series with the HF path. I'm too lazy to try to draw it in ascii, but I hope you get the idea.

I haven't actually tested this, it is just a guess.

Please post your results, if you try it out.

Do you have web access? Analog Devices home page has a search engine at
the opening screen. I entered AD737 and got it. They're www.analog.com.

I've used the 737 in a signal measuring setup before, and it's a pretty
good chip. There are easier ways (i.e., more ham like). Pretty sure that
Solid State Design for the Radio Amateur covers these if you'd rather.
They involve using differential hot carrier diodes driving an op amp,
with perhaps some bias to get down to the -20 dBm level.

73,
Bob

I did too, but I always used multipliers in lieu of dividers.

The trick in soldering is to abandon the traditional soldering iron ...
get solder paste with "no-clean" flux (from ESP, for example ...
(800) 338-4353) and do reflow soldering with a source of hot air
(a heat gun will work in a pinch, if you keep your distance and are
careful) ...

SMT is NOT impossible, or even difficult, to work with ... IF you
take the effort to learn some new techniques ... however, this seems
to be a MAJOR problem for far too many hams ... far too few seem
willing to learn anything, let alone something modern ...

make an oven than a TCXO. A peltier heater is unnecessary as the crystal
will hace a minimum temperature coefficient above 27C
Your crystal will be an AT (lazy Z) cut optimised for minimum deviation
over the whole band. If you temperature control just the crystal it
should be possible to raise the temperature by using a servo heater to
where the crystal reaches its minimum frequencey with luck and if the
crystal is correctly cut this will be about 35C.
The Maintaining circuit will still be sensitive to temperature and will
limit any crystal only control to +-0.5ppm or so.

From: "Jeff W. Hockert" <hockerj@ece.orst.edu>
Subject: 2 meter antenna

I've just finished building a variation on this sleeve antenna which seems to work OK. I need to borrow a VHF SWR bridge and trim it yet, and then I can compare it to the J-Pole I've been using. My question is, should the two sides of the dipole be shorted together?

My antenna is constructed with 1/2 wavelength of copper 3/4" pipe over the feeding coax, with the braid shorted to the pipe at the midpoint of the antenna. The other half the dipole is base loaded to be electrically 3/4 wavelength long and physically 5/8 wavelength (I used a section of 1/8" steel rod with the coil making up the remainder of the length... I used a piece of solid phenolic plastic rod that plugs the end of the copper pipe and extends up as the coil form, and drilled out the center of the rod to set the steel element in). I am currently feeding the base of the loading coil with the coax center conductor, and do NOT have the two halves shorted... is this correct?

TIA,
Jason, N7IME

Hi Dave

I've done quite a bit of work with SM packages in my microwave work. There is no real problems, any more than with other type, the R's and C's take a bit of geting used to (they fly round the shack really well if you get the mounting wrong!), but it just requires new skills to be learnt, but certainly not difficult or impossible for Mr Average Ham.

On a tangential issue, has anyone done much hobby work with the new
SOT gull-wing or even surface mount packages? The "pin" spacing on
some of these is getting awfully small. I've gotten a few samples of

some nice IC's I's like to evaluate, but etching and soldering at
those line widths makes me wonder if at some point the amateur
homebrewer is going to get scraped off.

I was issued a 454 when I joined a research project at the University
of Essex in 1970. The only more beautiful thing was the young lady
who came with it. (The 454 is no longer with me).

it is fairly easy to go much further down than this!
With 2x 1N270, or better AA119 type germanium diodes and CA3140E
OP-amp you can measure down below -46dBm up to at least 600MHz.

I made a correction amplifier using several 1N4148 for each range, but
today, I would have tried a CA3140E buffer, with a possible log.amp
and connect this to a datalogger, which may be calibrated for every

10dB range, with some possible frequency calibration (like the one you have on SHF power meters). With this circuit you might measure below -40dBm on 1,296GHz, and still have useful sensitivity above 2.320 GHz. But you have to calibrate the circuit yourself. This is accomplished by borrowing a signal generator from work or from a friend (most SHF friends have some sort of reliable signal generators)

From: tait@primeline.net (Gary Tait)
Subject: Antenna rotator control box schematic needed.

I am looking for plans for a tv antenna rotator. It is one of the ones that the antenna mast goes through. It is a 4 wire, with the wires connected internally as follows:

1: Black, Motor common
2:Yellow , motor, switch NO
3:red , motor,switch NC
4:blue , switch common through 27 Ohm 5W Resistor.

The switch opens/closes about 30+ times per revolution of the mast.

I would like to build an electronic control box using discrete TTL chips if possible.

the ceramic resonnators are fine for oscillators, and they may be
pulled more than comparative xtals. I am sure you may use them for
filters, I have seen a BP-filter for 7MHz band using such devices

I posted some info on a newsgroup some times, but obviously this
attracted little interest or nobody makes any experiments any more?
I have made experiments with oscillators using ceramic resonators for
250, 480, 960kHz, and 3,58, 4.0 MHz
it is easy to pull a 3.58MHz element to cover 3.5-3,6MHz in a VFO
An oscillators using ceramic resonnators should have some 3 times
higher capacitor values than xtal oscillators to operate
satisfactorily

From: k3ky@juno.COM (David E Sinclair)
Subject: Cheap/decent 12V supply?

Using the 12V supply only from a 5V/12V computer supply probably would not
work well for charging a 12V lead/acid car battery. More voltage is needed. If
the two supplies in the computer unit are not ground referenced, then they
could be series-connected for 17V. Some simple circuitry could be used to
control or limit the battery charge current. There are several approaches
such as constant voltage, constant current, taper charging, etc. I will be glad
to supply references/schematics, etc. on request. Some other writers have
pointed out correctly that a linear supply would be a better choice than a
noisy computer switching supply, and that one or both supplies in the switch-
ing unit may have a minimum current requirement. That can be easily met with
various types of loads added in parallel with the supply needing it.

For RF prototyping where I used to work, they used little single-sided PCBs about 1" square, with adhesive backing, with a surface mount pattern for a single chip brought out to wider pads. These were positioned on the Cu side of a piece of PCB laminate and the circuit wired up directly on the Cu ground plane with wire-wrap wire or self-fluxing magnet wire. I'll ask someone there where they got the things from. They were very cheaply made, and were free issue in the lab. I should have liberated a few before I left. 8-(

DC has no skin effect, which is important even at 50 Hz for very large currents. DC has no radiation losses, which is also significant at 50 Hz over long distances. For a given RMS, DC has a 30% smaller peak current and peak voltage. DC has no capacitively coupled current loss (not the same as leakage current) therefore power factor loss, through the insulation into the salt water. This capacitive current can cause electrolysis effects.

From: n4mxf@aol.com (N4MXF)
Subject: power transmission (electric)

Hi,
I've been an engineer (manager) in the undersea cable business for 30 years and know of only a few DC cable projects for very specific applications. DC would not be an effective way to transmit power. High voltage pluse cables for digital transmission (very low current) are the only cables I know fit your discription. These are not power cables. Undersea power transmission are larger cables and are usually 5,15,35,64,130kv cables having conductors with thousands of circular mils and range from 4" to 8" diameters. There are some even larger. Cables usually contain 3 or 4 main conductors and are operated in a three phase (balanced) configuration. Today, many undersea power cables contain optical light guides (fiber optics) for signal transmission. Corona is normally controlled by proper shielding and the use of semi-con materials. External damage is the major cable failure although the we still like to get excited over the effects of "treeing" (crack propagation within a dielectric due to electro stress). If you would like any more details on cable or cable useage, drop me an email. Oxford,William & Associates:

Cable Systems Consultants. wjoxford@aol.com or N4MXF@aol.com. 73 Bill

>
> Comments here or remove the ! to reply via e-mail...73 all, Web Williams

Well, not quite! I have to argue against two of your points or
suggestions.
The cyanide is NOT just a cleaner. The silver ions bind to the
cyanide ions in a way leaving hardly any free silver ions in the plating
solution. (One book reports about 1 free silver ion per cubic
centimeter. That is a VERY small amount of silver. An ion is
esstentially just an atom.)
Why is that important? If there are many free ions and you stick
almost any metal into the solution the silver ions will pick up an
electron from the metal and become metallic silver while one of the
substrate ions will go into solution. This is the secret of
"electroless" plating. Sounds wonderful, but it is not; the metal
deposited this way is poorly bonded and can be often wiped off with a
rag. It is also porous. Metals going into solution include copper,
zinc, iron, practically anything except gold and platinum!
The other objection is rubbing silver onto a hot surface. Actually,
it probably could be made to work, if you are good and work fast. The
problem is that the melting point of silver is lower than the melting
point of copper (probably higher than for brass), but not a lot lower (a
bit over 100 degrees C.) You are at risk of melting the copper if you
heat with a tourch. It would work better with a silver bath (want to
melt a liter of silver in the kitchen?) with good temperature control.
There is another problem; the silver and copper rapidly alloy to form
a lower melting point alloy. If you do not work fast this process can
cause holes to develop as the alloy forms ever deeper into the
substrate. This is something you will understand better if you ever did
soldering on fine copper wire with lead-tin solder. The wire disappears
if you are too slow. The silver/copper process will be faster. You will

get a great bond, if you are good enough.

Bob

FreqMax/FreqMin= SQRT(1.346)= 1.16= 16%

Thus the max to min capacity should change.

But I could not detect the change in frequency coverage
after adding the second varactor.
(Maybe I made an error in my experiment.)

I guess that my question was, is the maximum capacity really
going to double when you paralell another varactor across the
varactor of a VCO. I am specificall talking about (1 varactor
VCO) and NOT the 2 back-to-back varactor VCO.

I dont really know, but, I think that the one varactor VCO
drives the varactors in a highly non-linear way.There will be 5-10
volts RF/AC across the varactor, and 1-10 volts DC to tune it.
Thus, I believe that varactor will be working in a highly nonlinear
way. Also, Q is rather low for these types of varactors.

Anyway, I try this varactor paralleling again, and hopefully I had
done something wrong earlier, and paralelling varactors really
does increase their max capacity in case of a VCO.

Thanks for your thoughts.

MAYBE. Each device (tube, FET, MOSFET, BJT) has a diffrent set of
parameters. Even each type of tube(6J6, 6AK5, 6DJ8) differs as
to G-P, G-C, C-P capacitances, and their transconductance.

I guess the key is to design around the limitations of the device
that we are using.

These limitations are not very difficult to design around for FETs.
MPF102 is not a very good FET for RF usage. Though it
is still usable.
You can use a dual gate MOSFET like 40673 3SK174 etc,
but their is not likely to be a lot of difference between that
and a properly designed circuit using J-310.
( J-310 is a good device for general RF usage, much better than
MPF-102).

I guess the key is balance.

1.Just enough RF gain to give you a good noise figure with the antenna
and frequency you intend to use it with. Too much gain and you may
compromise the cross modulation performance. If your front end(mixer)
is sensitive enough, you might not need any RF gain atall.

2. Impedance matching. This cannot be stressed enough.
In fact they say that the key to SUCCESSFUL RF design is
impedance matching!
1.Match antenna impedance to input tuned circuit. If you have a
large antenna, use a 1 turn link to couple the antenna.
If all you have is a 6 feet whip as an antenna, connect it to the
top or the hot end of the antenna.
2. Match source impedance to input tank. Generally 2 turns should
be all that is needed.
3. Match drain impedance to output tank. Around 50% or should be good.

3. Adjust input and output loading.More loading means less circuit Q
whcih might help in adjusting BAND coverage and tracking between
input and output circuits.
Less loading will make tuning much more sharp and increase
circuit Q.
4. Having adjusted loading , you might want to go to Step 2 to fine

tune the impedance matching, though it should not be really
neccessary.

5. If you still have problems with crossmodulation, run the FET
as HOT as possible, i.e. with as much drain current as possible.
I guess around 20 mA or so.
It was stated somewhere that even a BJT can have very good
crossmodulation performance better than a dual gate MOSFET
by running it at about 20-50 mA or so.
Device linearity is greatly increased and crossmodulation reduced
by running the device hot enough.

6. Use of pads can improve cross modulation performace.
This is suggested if you have a large antenna.

7. Also, it might be good idea to bear in mind that the
Cross MOD performace of the mixer should be high enough
for you to use a RF pre amp.
DONT even think about using an preamp with a NE602 mizer front end
or general coverage portable SW radios receievers. Just use
a passive 1-2 tuned circuit filters . A lot of performance gain
can be acheived just by proper impedance matching and NO FET
rf amp.
Please think about the NO FET(or tube or transistor) RF amp also!
It produces RF gain by proper impedance matching.

From: la8ak@online.no (J M Noeding)
Subject: measuring VVC-diodes, how?

Hi
I need to calibrate capacitance diodes to voltage to use them in a
2-50MHz impedance meter. I believe it may not be a good idea to
measure the capacity using a C-meter, since signal voltage level may
be much higher than the actual dc voltage used.
I have a Radiometer Q-meter, but I would prefer an easier way than
measuring the influence on a tuned circuit.
Any better suggestions? What does manufacturers use?

Not much, if there are a lots of different pagers in different
frequencies.

A good choice might be a sharp bandpass filter--the bigger the
better. One the size of a loaf of bread might do the trick, though
people have made them out of 20 gallon garbage cans... Zack W1VT

Frank, tell us a bit about what you're trying to accomplish, maybe we can
suggest alternate approaches using more common parts.

>>Why do power companies use DC to transmitt power. 400KV, 500MW. What
kind
>>of equipment is used to transform from AC to DC and DC to AC?
>>Could it be power factor?
>>73 and TIA
>
>The main reason is that DC is subject to only the resistance losses in
the conductors. The line inductance and capacitance does not cause
reactive voltage drop is a DC transmission line. In an AC line these
losses are serious and must be corrected wth very expensive capacitor
banks.

The reason that DC is not often used is that the cost of the high
voltage solid state conversion systems have been very expensive in the
past. Recently these cost have dropped and more DC transmission lines
are being considered and will be built.

The merits of DC vs AC power generation,transmission, and distribution
were highly debated at the turn of the century by Edison (DC) and Tesla
(AC). Tesla eventually won the debate, but with the changes in
technology of the next century, Edison and DC may be exonerated.

Either the phasing or "Weaver" techniques can be used to build a
simple "single signal" receiver and a SSB transmitter, too ... it is
possible to obtain substantial undesired sideband suppression without
too much difficulty ... especially with DSP techniques ...

Hi all,

The principle problem with the responses to this topic is that
amateurs employ what is called "pre-amps". Much of what follows this
presumption is correct, but inappropriate to SWL (due to the presumed
application of the "pre-amp").

Modestly priced receivers often used by SWL'ers do NOT need wideband
amplification, and their receivers are not atmospheric noise limited.
As already identified, filtering pays off and post-amplification would
return the filter's loss with perhaps some overall gain improvement.
The term for such a device is Pre-selector. Hams having been for

years passive in construction practices have allowed commercial
vendors to dominate design issues by virtue of offering "features."

A good receiver has front end tuning, often several tuned RF stages
prior to the first mixer. These stages are rare in current designs
having been consigned to the dust-bin by marketing department design
choices. Simply put they view that the Ham would rather have his hand
wither than reach for a "tuning" knob. That it isn't built into the
VFO knob is again a marketing issue in that cost issues arrise.
Tracking and alignment problems abound requiring the parts count to
push against the profit margin.

I have three friends with front-end overload problems from a nearyby
AM commercial station. Their rigs are top of line Kenwoods and they
suffer the same as my lowly DX-440 which cost an eighth of their
price. Both the DX-440 and these Kenwoods suffer the same design
shortfall: wide open front ends (OK so they are Band filtered, they
suffer all the same!). Pre-selectors would solve the problems all
around, but I already know my friends would shudder to have to reach
for a second knob (much less tuner). They conform to the expectations
of Marketeers and their purchases have validated the entropy of
design.

SWL'ers look for construction projects for Pre-selectors or tuned
pre-amps. This is the single greatest improvement you can make
outside of building IF ancillaries such as Q-multipliers, crystal
lattice filters, or another stage of mixing to a lower, narrower IF.
Also, do not neglect the Tuner as the cheapest means to reject noise
and interfering stations. Sophisticated tuning networks with reject
notches also keep cost low. Much of this material was present in the
ARRL Handbooks of the '60's. I hope these common engineering issues
haven't become folk-lore through neglect.

## 2152. 10 watt AM tramsmitter circuit

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-25 00:00:00 UTC
From: ianls@patrol.i-way.co.uk
Message-ID: <3401df8f.36047030@news.i-way.co.uk>
Source record: 91426

Does anyone know of a transistor/FET circuit for 12-14 Volts for an AM
160 or 80 mtr transmitter? Power output preferably 10 watts or so.
It's relatively easy to get 5 W, but a 24 volt rail seems necessary
for more than this. Thanks,

## 2153. Ct17 and Icom transceiver controlled by a pc

Newsgroup: rec.radio.amateur.homebrew

Try the BUX range of Phillips semiconductors. There are also devices in the 2SD xxxx range. Many are used in the unfriendly - high voltage environment of Horizontal Output stages of TV's but I think most will be NPN's.

Alan - VK3XPD

Sounds like the conditions are similar to the parametric amplifier or varactor tripler :-).

If the high RF voltage across the varactor is your problem, then why not use a varactor with large maximum capacitance (a tuning range from ,say, 25 pF to 250 pF) in series with a small (say 100 pF) fixed capacitor. The two capacitances will form a capacitive voltage divider, at the minimum capacitance the AC voltage across the varactor is only slightly reduced but at maximum capacitance only a very small fraction of the RF voltage is across the varactor (2/7 in this case). This greatly reduces the risk for forward biasing at low tuning voltages.

Your problem seem to be the large parallel capacitance, so it is quite unrealistic to expect to get any large tuning range with varactors with low maximum capacitance. With values in my example, you would get sqrt ( (100+71)pF/(100+20)pF ) = 1.19 or 19 %. Using a larger series capacitance would make the tuning range even larger, but it would also increase the RF voltage across the varactor.

Paul OH3LWR

From: "P. Singh" <singhpk@NOSPAM.exit109.com>
Subject: VCO , paralleling Varactors

Does anybody know why paralelling another varactor across
the varactor of a LC Voltage controlled oscilator not increase
the tuning range of the VCO?

Both the varactors are reverse biased by the tuning voltage,
as varactors should be. So, connecting another varactor
across the LC tank circuit of a VCO should increase the freq
range of the VCO by 50% or so. It only does so by 1-5%. WHY?

They AC voltage across the tank circuit is going to be about 10 volts or so. The DC bias voltage for the varactor is about 1-10 volts or so. So, is it that the varactor is working in a totally nonlinear way?

Will connecting two varactors back-to-back and then paralelling
work. Or they still might be operating in a non linear way?

Does any body have any experience with paralelling single varactors
across the LC tank circuit of VCO.

ANy insight / help is greatly appreciated.

Thanks

You might try NTE for a direct substitute? They have a searchable table
for all kinds of semiconductors at http://www.nte.com/

> (snip)

Maybe you should have a look at a more recent issue? My latest
copy (1996) discusses regens as primarily a historical thing, but
considers direct conversion receivers to be an effective way of
receiving signals.

I can think of a number of important designs between 1988 and 1996
that would have changed the perception of DC receivers as cute toys,
but not serious receivers...

As always, you get what you pay for. An extremely simple receiver
will get the job done under some circumstances, but may not
hold up under extreme conditions.

From: norman <norsan@bright.net>
Subject: Value of Dow-Key relay?

Dow key relays can be used for much more than switching from transmit to
receive in boatanchors. Some uses are:

switching between 2 antennas
switching in/out a preamplifier at the antenna
switching transverters to a common IF
switching rigs to a SWR meter

and many more.

<snip>

Perhaps the problem with paralleling two varactors is that the two diodes is not matched, resulting in more current flowing in one of the diodes.
Try using two resistors (and RFCs), to separate the bias voltages, and use two (relatively) large capacitors in series with the HF path. I'm too lazy to try to draw it in ascii, but I hope you get the idea.

I haven't actually tested this, it is just a guess.

Please post your results, if you try it out.

Do you have web access? Analog Devices home page has a search engine at
the opening screen. I entered AD737 and got it. They're www.analog.com.

I've used the 737 in a signal measuring setup before, and it's a pretty
good chip. There are easier ways (i.e., more ham like). Pretty sure that
Solid State Design for the Radio Amateur covers these if you'd rather.
They involve using differential hot carrier diodes driving an op amp,
with perhaps some bias to get down to the -20 dBm level.

73,
Bob

From: "P. Singh" <singhpk@NOSPAM.exit109.com>
Subject: 11volts from 12 volts...

Hi bill,

Almost every 12 volt supply I have built using a 3 terminal
fixed regulator puts out about 11.5 volts or so. It seems
that the 12 volt regulators are manufactured with WIDE
tolerances.

Just use a diode or two in the ground lead of your 3 terminal reg
to increase output 11 volts to 12 volts or so.

D1, D2= In4001
C1= 10uf/16volts electrolytic

D2

From: "Howard N. Lute" <OptCamel@sj.bigger.net>
Subject: Cheap/decent 12V supply?

These cheap switching power supplies are terrible choices for radio use,
far too noisy. Best is battery ONLY...a decent 12V Lead Acid car battery
used AS-IS (sans charger) then when you switch OFF your set up...you
turn ON the charger.
Simple, Cheap, loads of current and, best of all, quiet.
friend,
Lute

make an oven than a TCXO. A peltier heater is unnecessary as the crystal
will hace a minimum temperature coefficient above 27C
Your crystal will be an AT (lazy Z) cut optimised for minimum deviation
over the whole band. If you temperature control just the crystal it
should be possible to raise the temperature by using a servo heater to
where the crystal reaches its minimum frequencey with luck and if the
crystal is correctly cut this will be about 35C.
The Maintaining circuit will still be sensitive to temperature and will
limit any crystal only control to +-0.5ppm or so.

From: "Jeff W. Hockert" <hockerj@ece.orst.edu>
Subject: 2 meter antenna

I've just finished building a variation on this sleeve antenna which seems to work OK. I need to borrow a VHF SWR bridge and trim it yet, and then I can compare it to the J-Pole I've been using. My question is, should the two sides of the dipole be shorted together?

My antenna is constructed with 1/2 wavelength of copper 3/4" pipe over the feeding coax, with the braid shorted to the pipe at the midpoint of the antenna. The other half the dipole is base loaded to be electrically 3/4 wavelength long and physically 5/8 wavelength (I used a section of 1/8" steel rod with the coil making up the remainder of the length... I used a piece of solid phenolic plastic rod that plugs the end of the copper pipe and extends up as the coil form, and drilled out the center of the rod to set the steel element in). I am currently feeding the base of the loading coil with the coax center conductor, and do NOT have the two halves shorted... is this correct?

TIA,
Jason, N7IME

Hi Dave

I've done quite a bit of work with SM packages in my microwave work. There is no real problems, any more than with other type, the R's and C's take a bit of geting used to (they fly round the shack really well if you get the mounting wrong!), but it just requires new skills to be learnt, but certainly not difficult or impossible for Mr Average Ham.

On a tangential issue, has anyone done much hobby work with the new
SOT gull-wing or even surface mount packages? The "pin" spacing on
some of these is getting awfully small. I've gotten a few samples of

some nice IC's I's like to evaluate, but etching and soldering at
those line widths makes me wonder if at some point the amateur
homebrewer is going to get scraped off.

I was issued a 454 when I joined a research project at the University
of Essex in 1970. The only more beautiful thing was the young lady
who came with it. (The 454 is no longer with me).

> this (Too much gain? Why would the lead length matter?)

The lead length doesn't matter so much as the circuit's design. The problem with that circuit is that it's inherently unstable when its input and output are tuned. (Grounding a JFET's gate doesn't shield O from I as grounding a vacuum tube's grid can do.) The MPF102 isn't a very gainy JFET, so if you tap the I/O tuned circuits down far enough and/or stagger the I/O circuits' tuning, *and* there's sufficient loading at I and/or O, the circuit may not oscillate.

That circuit also disserves you by getting much less selectivity out of two tuned circuits than can easily be achieved with them.

A better approach is to close that book and use a circuit engineered for predictable gain and stability. One recommendation is the single-40673 amplifier described by Wes Hayward, W7ZOI, in November 1981 *QST*'s "Progressive Communications Receiver," later carried in many subsequent ARRL *Handbook*s under the title "High-Performance Communications Receiver" (it's in the 1992 edition, for instance). (Yes, 40673s are now "new old stock," but you can also use an ECG222, NTE222, MPF131, 3N187 and 3SK [Japanese] or BF [European] equivalents. Dual-gate MOSFETs may be passe over in the US, but in Japan and Europe they're still very much viable. The Japanese in particular have taken receive-class JFETs and MOSFETs much

further than manufacturers here; even the [old] 2SK125, for instance, is
much better than the best [J310/U310] generally available here.)

When you combine Hayward's amplifier with the appropriate
double-tuned-circuit output filter (described in the same article that
describes the amplifier), you'll have good, predictable gain (10 dB) *and*
the selectivity you need. Wes's circuit isn't the only possible solution
to your problem, of course, but it has withstood the tests of time and use
that the other circuit hasn't.

it is fairly easy to go much further down than this!
With 2x 1N270, or better AA119 type germanium diodes and CA3140E
OP-amp you can measure down below -46dBm up to at least 600MHz.

I made a correction amplifier using several 1N4148 for each range, but
today, I would have tried a CA3140E buffer, with a possible log.amp
and connect this to a datalogger, which may be calibrated for every
10dB range, with some possible frequency calibration (like the one you
have on SHF power meters). With this circuit you might measure below
-40dBm on 1,296GHz, and still have useful sensitivity above 2.320 GHz.
But you have to calibrate the circuit yourself. This is accomplished
by borrowing a signal generator from work or from a friend (most SHF
friends have some sort of reliable signal generators)

From: tait@primeline.net (Gary Tait)
Subject: Antenna rotator control box schematic needed.

I am looking for plans for a tv antenna rotator. It is one of the ones that
the antenna mast goes through. It is a 4 wire, with the wires connected
internally as follows:

1: Black, Motor common
2:Yellow , motor, switch NO
3:red , motor,switch NC
4:blue , switch common through 27 Ohm 5W Resistor.

The switch opens/closes about 30+ times per revolution of the mast.

I would like to build an electronic control box using discrete TTL chips if
possible.

the ceramic resonnators are fine for oscillators, and they may be
pulled more than comparative xtals. I am sure you may use them for
filters, I have seen a BP-filter for 7MHz band using such devices

I posted some info on a newsgroup some times, but obviously this
attracted little interest or nobody makes any experiments any more?
I have made experiments with oscillators using ceramic resonators for
250, 480, 960kHz, and 3,58, 4.0 MHz
it is easy to pull a 3.58MHz element to cover 3.5-3,6MHz in a VFO
An oscillators using ceramic resonnators should have some 3 times
higher capacitor values than xtal oscillators to operate
satisfactorily

From: k3ky@juno.COM (David E Sinclair)
Subject: Cheap/decent 12V supply?

Using the 12V supply only from a 5V/12V computer supply probably would
not
work well for charging a 12V lead/acid car battery. More voltage is
needed. If
the two supplies in the computer unit are not ground referenced, then
they
could be series-connected for 17V. Some simple circuitry could be used to
control or limit the battery charge current. There are several approaches
such as constant voltage, constant current, taper charging, etc. I will
be glad
to supply references/schematics, etc. on request. Some other writers have
pointed out correctly that a linear supply would be a better choice than
a
noisy computer switching supply, and that one or both supplies in the
switch-
ing unit may have a minimum current requirement. That can be easily met
with
various types of loads added in parallel with the supply needing it.

For RF prototyping where I used to work, they used little single-sided
PCBs about 1" square, with adhesive backing, with a surface mount
pattern for a single chip brought out to wider pads. These were
positioned on the Cu side of a piece of PCB laminate and the circuit
wired up directly on the Cu ground plane with wire-wrap wire or self-
fluxing magnet wire. I'll ask someone there where they got the things
from. They were very cheaply made, and were free issue in the lab. I
should have liberated a few before I left. 8-(

DC has no skin effect, which is important even at 50 Hz for very large currents. DC has no radiation losses, which is also significant at 50 Hz over long distances. For a given RMS, DC has a 30% smaller peak current and peak voltage. DC has no capacitively coupled current loss (not the same as leakage current) therefore power factor loss, through the insulation into the salt water. This capacitive current can cause electrolysis effects.

From: n4mxf@aol.com (N4MXF)
Subject: power transmission (electric)

Hi,
I've been an engineer (manager) in the undersea cable business for 30 years and know of only a few DC cable projects for very specific applications. DC would not be an effective way to transmit power. High voltage pluse cables for digital transmission (very low current) are the only cables I know fit your discription. These are not power cables. Undersea power transmission are larger cables and are usually 5,15,35,64,130kv cables having conductors with thousands of circular mils and range from 4" to 8" diameters. There are some even larger. Cables usually contain 3 or 4 main conductors and are operated in a three phase (balanced) configuration. Today, many undersea power cables contain optical light guides (fiber optics) for signal transmission. Corona is normally controlled by proper shielding and the use of semi-con materials. External damage is the major cable failure although the we still like to get excited over the effects of "treeing" (crack propagation within a dielectric due to electro stress). If you would like any more details on cable or cable useage, drop me an email. Oxford,William & Associates: Cable Systems Consultants. wjoxford@aol.com or N4MXF@aol.com. 73 Bill

Well, not quite! I have to argue against two of your points or
suggestions.
The cyanide is NOT just a cleaner. The silver ions bind to the
cyanide ions in a way leaving hardly any free silver ions in the plating
solution. (One book reports about 1 free silver ion per cubic
centimeter. That is a VERY small amount of silver. An ion is
esstentially just an atom.)
Why is that important? If there are many free ions and you stick

almost any metal into the solution the silver ions will pick up an electron from the metal and become metallic silver while one of the substrate ions will go into solution. This is the secret of "electroless" plating. Sounds wonderful, but it is not; the metal deposited this way is poorly bonded and can be often wiped off with a rag. It is also porous. Metals going into solution include copper, zinc, iron, practically anything except gold and platinum!
The other objection is rubbing silver onto a hot surface. Actually, it probably could be made to work, if you are good and work fast. The problem is that the melting point of silver is lower than the melting point of copper (probably higher than for brass), but not a lot lower (a bit over 100 degrees C.) You are at risk of melting the copper if you heat with a tourch. It would work better with a silver bath (want to melt a liter of silver in the kitchen?) with good temperature control.
There is another problem; the silver and copper rapidly alloy to form a lower melting point alloy. If you do not work fast this process can cause holes to develop as the alloy forms ever deeper into the substrate. This is something you will understand better if you ever did soldering on fine copper wire with lead-tin solder. The wire disappears if you are too slow. The silver/copper process will be faster. You will get a great bond, if you are good enough.

Bob

From: "P. Singh" <singhpk@NOSPAM.exit109.com>
Subject: VCO, paralelling varactors

FRANK,

I guess I was not as clear as I should have been.

1 varactor VCO ( MV109)
case 1: CFIXED = 100 PF
CVARACTOR= 2-20PF
CTOTAL= 102-120 PF
Cmax/cmin= 1.176
FreqMax/FreqMin= SQRT(1.176)= 1.085 or 8.5%

2 paralell Varactor VCO( 2*MV 109)
case 2: CFIXED = 100 PF
CVARACTOR= 4-40PF : 2 varactors in parallel
CTOTAL= 104 to 140 PF
Cmax/Cmin= 140/104= 1.346

FreqMax/FreqMin= SQRT(1.346)= 1.16= 16%

Thus the max to min capacity should change.

But I could not detect the change in frequency coverage
after adding the second varactor.
(Maybe I made an error in my experiment.)

I guess that my question was, is the maximum capacity really
going to double when you paralell another varactor across the
varactor of a VCO. I am specificall talking about (1 varactor
VCO) and NOT the 2 back-to-back varactor VCO.

I dont really know, but, I think that the one varactor VCO
drives the varactors in a highly non-linear way.There will be 5-10
volts RF/AC across the varactor, and 1-10 volts DC to tune it.
Thus, I believe that varactor will be working in a highly nonlinear
way. Also, Q is rather low for these types of varactors.

Anyway, I try this varactor paralleling again, and hopefully I had
done something wrong earlier, and paralelling varactors really
does increase their max capacity in case of a VCO.

Thanks for your thoughts.

Try JDR Microdevices. They list mylar (polyester film) capacitors.

They also have a web page. I am not sure of the address. Use any of

the search engines to find them. Otherwise, order toll free phone:
1-800-538-5000

use two (relatively) large capacitors in series with the HF path. I'm
too lazy to try to draw it in ascii, but I hope you get the idea.

I haven't actually tested this, it is just a guess.

Please post your results, if you try it out.

Do you have web access? Analog Devices home page has a search engine at
the opening screen. I entered AD737 and got it. They're www.analog.com.

I've used the 737 in a signal measuring setup before, and it's a pretty
good chip. There are easier ways (i.e., more ham like). Pretty sure that
Solid State Design for the Radio Amateur covers these if you'd rather.
They involve using differential hot carrier diodes driving an op amp,
with perhaps some bias to get down to the -20 dBm level.

73,
Bob

The silver is all removed when the film is "fixed". The sodium
thiosulfate fixer after it has been used, contains the silver, not the
developer.

My experience is silver plating is that using spent fixer doesn't work
well. The only method I have found , that works is to use a sodium
cyanide process. This involves disolving silver in nitric acid to adding
salt to generate a cheap silver halide salt and then disolving it in
water with the cyanide. The plating is done electrolytically.

I did it once and don't recommend it. The silver plating was beautiful
BUT... The cyanide gas can easily kill you.

Subject: fs-UTC Interstage X-Formers

Hi All;
I have these four United Transformer Corp. transformers for SALE:
2ea. CVP-2, one new
2ea. CVP-1, both used!
I have no need for these, so if someone can use 'em, please make me a fair

offer. Please remember that they are heavy and that I have to spend to
ship
'em.

Thanks es 73..........RICH RLUCCH2098@aol.com

>temporary bench tests only.
>--

I have 4 each, new Dow-Keys with N connectors, the Rx isolation button,
and DPDT external contacts. They have 12 volt DC coils (which are
replaceable if you don't like 12 VDC) Bought 15 years ago when I was into
moonbounce. They handle KW at 432 MHz, although I don't think they are
rated for it.

$50 each

From: "P. Singh" <screwed@nospam.net>
Subject: VCO , paralleling Varactors

<Two pairs> of varactors paired connected in paralell.
Does a pair of varactors mean two varactors wired back-to-back?
This might work if you are paralelling back to back pairs of
varactors .

I tried to paralell single varactors across a LC tank of
a VCO.

Also, the circuit where I tried this varactor paralelling is in
the VCO that comes in the Ten-TEC QRP CW kit model 1340 .

The tuning range of the VCO inside this kit at 40 M is 70 KHZ.

This VCO drifts like crazy. (yes I have glued the toroid to the
PCB with hot melt glue)

This VCO uses 1 tuning diode MV2109 for tuning it. This VCO
tunes DOWN i.e. 4.00 to 3.930 for covering 7.00 to 7.070 .

I figured that sticking another varactor diode across the
already present MV2109 should make it tune something like
7010 to 7110 or so.

Boy, was I wrong! It hardly changed anything .

Anyway, how do you bias a varactor high enough at about
20-30 volts so that it does not draw current from the LC
tank circuit of the VCO and still have enough tuning range!

Well , you might use a large varactor like 100 PF varactor
and use a 20 PF bias range around 20-30 volts or.
Didnt someone tell me that large varactors have LOW Q
inherently.Also, large varactors are noisier.

Also, generating a 20-30 volt tuning voltage is a problem
in gear like this.

So, we are back to where we started.

The Ten-Tec guys do get a terrific tuning range at about 70 KHZ
on 40 M for their 1 varactor VCO, with a tuning voltage of
1-6.8 volts I think.

Well, they used to used 2 back to back varactor at one time for
VCO etc, but that increases the cost 4:1 for varactors.

I think it is nowadays more fashionable to use 1 varactors for
LC tank of VCO, even though that will reduce the circuit Q and
stability. I guess that the resultant lower cost and the use
of the VCO with a synthesizer chip is the reason for this.

So, it seems like that the varactor is drawing current from the
tuned circuit!
Well that must be shooting down the LC circuit Q as well, and,
resulting in drifting etc.

this is solved in some extent by using a twin diode combination where
two diodes are connected back-to back. 20 years ago it was some notes
on oscillator applications in Radcom, Technical topics. Perhaps some
is now found in G3VA Amateur Radio Techniques?

---

MFJ-AMERITRON is a mailing list (reflector) devoted to the
discussion of radio equipment manufactured by MFJ Enterprises
of Starkville, Ms and affiliates (Ameritron, Mirage, etc).

* Amateur Radio Equipment
* Multimode, Packet Data Controllers
* HF and VHF Amplifiers
* Accessories
* QRP, VHF, Test Instruments
* Buy, Sell
* Anything MFJ Related

To join the mailing list, send email as follows:
TO: majordomo@qth.net
SUBJECT:
BODY: subscribe MFJ-AMERITRON

To be removed from the mailing list, send email as follows:

They better not have current flowing in them! If they do, you're in a heap
of trouble. You need to keep them biased heavily enough so that they NEVER
draw current...During ANY part of the RF cycle. Within manufacturing
tolerances, 2 in parallel exhibit double the capacity of a single one at
the same voltage.

What's really tough, is that the Q of the varactor nosedives at the lower voltages (Higher C). Further, you have to keep the bias high enough so that the thing doesn't become forward biased during part of the RF cycle. You usually wind up in oscillator applications, with just using the high end of the voltage range for the above reasons, getting lower delta C and need to parallel several to gewt the tuning range you need.

Not quite as important when you're just tuning a circuit with uVolts of RF on it, but the Q problem is still there.

They better not have current flowing in them! If they do, you're in a heap
of trouble. You need to keep them biased heavily enough so that they NEVER
draw current...During ANY part of the RF cycle. Within manufacturing
tolerances, 2 in parallel exhibit double the capacity of a single one at
the same voltage.

What's really tough, is that the Q of the varactor nosedives at the lower voltages (Higher C). Further, you have to keep the bias high enough so that the thing doesn't become forward biased during part of the RF cycle. You usually wind up in oscillator applications, with just using the high end of the voltage range for the above reasons, getting lower delta C and need to parallel several to gewt the tuning range you need.

Not quite as important when you're just tuning a circuit with uVolts of RF on it, but the Q problem is still there.

Do you have web access? Analog Devices home page has a search engine at the opening screen. I entered AD737 and got it. They're www.analog.com.

I've used the 737 in a signal measuring setup before, and it's a pretty good chip. There are easier ways (i.e., more ham like). Pretty sure that Solid State Design for the Radio Amateur covers these if you'd rather. They involve using differential hot carrier diodes driving an op amp, with perhaps some bias to get down to the -20 dBm level.

73,
Bob

In article <01bca730$b2f068e0$LocalHost@w9dmk.crosslink.net>,
w9dmk@crosslink.net says...
>
>How could their be any silver in photographic developing solution? The
>silver is in the emulsion. If you want silver in your developing
solution
>you have to first develop a hell of a lot of prints or film. OK?

The silver is all removed when the film is "fixed". The sodium
thiosulfate fixer after it has been used, contains the silver, not the
developer.

My experience is silver plating is that using spent fixer doesn't work
well. The only method I have found , that works is to use a sodium
cyanide process. This involves disolving silver in nitric acid to adding
salt to generate a cheap silver halide salt and then disolving it in
water with the cyanide. The plating is done electrolytically.

I did it once and don't recommend it. The silver plating was beautiful
BUT... The cyanide gas can easily kill you.

I have 4 each, new Dow-Keys with N connectors, the Rx isolation button, and DPDT external contacts. They have 12 volt DC coils (which are replaceable if you don't like 12 VDC) Bought 15 years ago when I was into moonbounce. They handle KW at 432 MHz, although I don't think they are rated for it.

$50 each

From: "P. Singh" <screwed@nospam.net>
Subject: VCO , paralleling Varactors

<Two pairs> of varactors paired connected in paralell.
Does a pair of varactors mean two varactors wired back-to-back?
This might work if you are paralelling back to back pairs of varactors .

I tried to paralell single varactors across a LC tank of
a VCO.

Also, the circuit where I tried this varactor paralelling is in the VCO that comes in the Ten-TEC QRP CW kit model 1340 .

The tuning range of the VCO inside this kit at 40 M is 70 KHZ.

This VCO drifts like crazy. (yes I have glued the toroid to the PCB with hot melt glue)

This VCO uses 1 tuning diode MV2109 for tuning it. This VCO tunes DOWN i.e. 4.00 to 3.930 for covering 7.00 to 7.070 .

I figured that sticking another varactor diode across the already present MV2109 should make it tune something like 7010 to 7110 or so.

Boy, was I wrong! It hardly changed anything .

Anyway, how do you bias a varactor high enough at about 20-30 volts so that it does not draw current from the LC tank circuit of the VCO and still have enough tuning range!

Well , you might use a large varactor like 100 PF varactor and use a 20 PF bias range around 20-30 volts or.
Didnt someone tell me that large varactors have LOW Q inherently.Also, large varactors are noisier.

Also, generating a 20-30 volt tuning voltage is a problem in gear like this.

So, we are back to where we started.

The Ten-Tec guys do get a terrific tuning range at about 70 KHZ on 40 M for their 1 varactor VCO, with a tuning voltage of 1-6.8 volts I think.

Well, they used to used 2 back to back varactor at one time for VCO etc, but that increases the cost 4:1 for varactors.

I think it is nowadays more fashionable to use 1 varactors for
LC tank of VCO, even though that will reduce the circuit Q and
stability. I guess that the resultant lower cost and the use
of the VCO with a synthesizer chip is the reason for this.

So, it seems like that the varactor is drawing current from the
tuned circuit!
Well that must be shooting down the LC circuit Q as well, and,
resulting in drifting etc.

this is solved in some extent by using a twin diode combination where
two diodes are connected back-to back. 20 years ago it was some notes
on oscillator applications in Radcom, Technical topics. Perhaps some
is now found in G3VA Amateur Radio Techniques?

5. ADI-PREMIER
6. REPEATERS
7. HAM-COMPUTERS
8. TVI-RFI-EMI
9. TEST-EQUIPMENT
10. YUPI
-----

MFJ-AMERITRON is a mailing list (reflector) devoted to the
discussion of radio equipment manufactured by MFJ Enterprises
of Starkville, Ms and affiliates (Ameritron, Mirage, etc).

* Amateur Radio Equipment
* Multimode, Packet Data Controllers
* HF and VHF Amplifiers
* Accessories
* QRP, VHF, Test Instruments

* Buy, Sell
* Anything MFJ Related

To join the mailing list, send email as follows:
TO: majordomo@qth.net
SUBJECT:
BODY: subscribe MFJ-AMERITRON

To be removed from the mailing list, send email as follows:
TO: majordomo@qth.net
SUBJECT:
BODY: unsubscribe MFJ-AMERITRON

To post to the mailing list, send email as follows:
TO: MFJ-AMERITRON@qth.net

This reflector is provided by Al Waller K3TKJ at no
cost and I (K7ON) perform the routine administrivia.

Please contact me with any questions: k7on@qth.net

---

GPS is a mailing list (reflector) devoted to the
discussion of the Global Positioning System and
uses relating to amateur radio, experimenting, or
other activities.

* Hand Held GPS Units
* Trackers
* Amateur Radio Applications
* Interfacing
* Buy, Sell
* Anything GPS Related

To join the mailing list, send email as follows:
TO: majordomo@qth.net
SUBJECT:
BODY: subscribe GPS

To be removed from the mailing list, send email as follows:
TO: majordomo@qth.net
SUBJECT:
BODY: unsubscribe GPS

To post to the mailing list, send email as follows:
TO: GPS@qth.net

This reflector is provided by Al Waller K3TKJ at no
cost and I (K7ON) perform the routine administrivia.

Please contact me with any questions: k7on@qth.net

---

STANDARD is a mailing list (reflector) devoted to the
discussion of radio equipment manufactured by Standard
Amateur Radio Products.

* VHF/UHF Radios, HTs, etc
* Buy, Sell
* Anything Standard Related

To join the mailing list, send email as follows:
TO: majordomo@qth.net
SUBJECT:
BODY: subscribe STANDARD

To be removed from the mailing list, send email as follows:

This reflector is provided by Al Waller K3TKJ at no
cost and I (K7ON) perform the routine administrivia.

Please contact me with any questions: k7on@qth.net

---

SPECIAL-EVENTS is a mailing list (reflector) devoted to the
discussion of Amateur Radio Special Events and Operating Events.
Operating Events (like Field Day or State QSO Parties) while
at times competitive lack some of the characteristics of a
true Amateur Radio Contest, but any related discussion is quite
welcome here.

* QSO Parties
* Special Events Stations
* Expedition Announcements
* On The Air Activities

To join the mailing list, send email as follows:
TO: majordomo@qth.net
SUBJECT:
BODY: subscribe SPECIAL-EVENTS

To be removed from the mailing list, send email as follows:
TO: majordomo@qth.net
SUBJECT:

Ten years ago DeMaw published in QST an article on 'Accessories
for your VFO' and also described the VFO he used for the
experiments. In it he decided to try, as the variable 'C',
an FET (junction type) with the required capaitance to swing
the tank over the range he wanted, in series.

I have tried the idea with some differences (minor) using a
remote pot to control the turn-on voltage to the FET and can
say that I will never be using varicaps again.

Get ahold of the QST Jan 1988 p31- etc. I used LEDs to create
the bias voltages necessary for control. Highly recommended.

Try feeding the FET drain thru the coil and bypass the series
'C' with a high value resistor, rather like a grid leak.

I e-mailed DeMaw and he's forgotten all about it! Such an
inventive mind.

From: "Jeff W. Hockert" <hockerj@ece.orst.edu>
Subject: 2 meter antenna

I've just finished building a variation on this sleeve antenna which seems
to work OK. I need to borrow a VHF SWR bridge and trim it yet, and then I
can compare it to the J-Pole I've been using. My question is, should the
two sides of the dipole be shorted together?

My antenna is constructed with 1/2 wavelength of copper 3/4" pipe over the
feeding coax, with the braid shorted to the pipe at the midpoint of the
antenna. The other half the dipole is base loaded to be electrically 3/4
wavelength long and physically 5/8 wavelength (I used a section of 1/8"
steel rod with the coil making up the remainder of the length... I used a
piece of solid phenolic plastic rod that plugs the end of the copper pipe
and extends up as the coil form, and drilled out the center of the rod to
set the steel element in). I am currently feeding the base of the loading
coil with the coax center conductor, and do NOT have the two halves
shorted... is this correct?

TIA,
Jason, N7IME

Hi Dave

I've done quite a bit of work with SM packages in my microwave work.
There is no real problems, any more than with other type, the R's and
C's take a bit of geting used to (they fly round the shack really well
if you get the mounting wrong!), but it just requires new skills to be
learnt, but certainly not difficult or impossible for Mr Average Ham.

On a tangential issue, has anyone done much hobby work with the new SOT gull-wing or even surface mount packages? The "pin" spacing on some of these is getting awfully small. I've gotten a few samples of some nice IC's I's like to evaluate, but etching and soldering at those line widths makes me wonder if at some point the amateur homebrewer is going to get scraped off.

## 2170. Satellite Questions

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-26 00:00:00 UTC
From: Paul <prg22@ix.netcom.com>
Message-ID: <3402F595.ACA@ix.netcom.com>
Source record: 91440
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

While I have been looking for satellite frequencies I noticed that some of the uplinks are below the 144-148 2 meter band, and some of the downlinks are also below the 2 meter and 440 band. While I can do the mars/cap modification to my radio to access those freqs, i have two questions... will the mars/cap mod void the warranty if I don't have a permit, and would I have to have a permit to transmit to the uplink of some of those satellites? I believe the frequencies are around 142 or 143 Mhz. By the way I have a Kenwood TH-79A.
Any help is greatly appreciated. Thank You.

post or e-mail any replies

With or without a permit, modifications will void most
manufacturer's warranties.

>and would I have to have a permit to transmit to the uplink of some of

>143 Mhz. By the way I have a Kenwood TH-79A.

You may not transmit to any satellite outside the ham bands
unless you are specifically authorized to do so by the
satellite system operator. That authorization may include
the need for a proper government license.

Amidon et al. is our best source. In a pinch, the companies
that sell to CBers -- er, I mean, people who home-brew
HF amps -- frequently have these cores but at a higher price.
Try Communication Concepts, RF Parts, Copper Electronics.

Are you making a two-port output transformer with these?
Be advised that old TV sets and cheap TV baluns contain
a two-hole ferrite core that is perfect for this application
if you are lucky enough to find a large one.

This core is something I always scrounge out of every old TV that
is unfortunate to come my parts-cannibalizing way -- the little
ones are perfect for the input transformer.

The old Motorola RF Data book has an excellent discussion of the
technique of making these transformers.

>i was wondering if anyone has plans for a good antenna for qrp backpacking

And if you want to operate QRP while walking along, a magnetic loop is probably the best. A 1.5 m loop (which would permit 80m operation) would be a bit unweildy, but a 1m loop would be more manageable. However, you'd sacrifice efficiency on all bands, especially on 80. I wonder if anyone has tried mounting a mag loop to a backpack. You'd have to be careful you didn't burn your nose, ears or other extremities if they came into contact with the high voltage part of the loop.

Seriously though, I found a 6ft CB whip fine for 28 Mhz pedestrian mobile operation - more info on my home page.

You'll need to measure the motional capacitance Cm of the crystal and the equivalent series resistance Rs of the crystal. Then the motional inductance Lm can be calculated from the resonant freq and Cm.

Rs is most easily measured in a standard 12.5ohm test fixture as described in the book "Crystal Filters: Design, Manufacture, and Application" by Robert Kinsman. Its a recent book available in many technical bookstores.

The paralled capacitance Cp can in many cases just be assumed as 5pf, but you could measure it in a capacitance meter.

Cm can be measured most easily by measuring the series resonant freq of the crystal with or without an external series cap, and then using a formula in Kinsman to calculate Cm.

The method shown in a number of QST articals using the 3db down freqs of the crystal in series resonance for calculating parameters is much more difficult than the above methods since the skirts of even a single high quality crystal make measuring those 3db points extremely sensitive to signal generator drift and accuracy. Of course, if you have a $5000 HP signal generator on your bench, then by all means, do it any way you want :)

Rob.

QST ran three articles on making crystal filters:

A Unified Approach to the Design of Crystal Ladder Filters
Wes Hayward, W7ZOI
May 1982, p 21

Designing and Building Simple Crystal Filters
Wes Hayward, W7ZOI
July 1987, p 24

A Tester for Crystal F, Q and R
Doug DeMaw, W1FB
January 1990, p 21

The first article outlined the theory and design. The second was another design. The last article was an implementation by DeMaw for an instrument described by Hayward to allow you to analyze the crystals you want to use in IF ladder filters.

All three articles are in the Appendix of:

W1FB's Design Notebook
Doug DeMaw, W1FB
(available from ARRL for $10)

> device? Thanks for any help.

Try Edmund Scientific for the dish, I used a 741 op amp and a 386N amplifier on a bread board. Worked VERY well. I used a plastic dish with one 1/4 " dia piece of all thread slightly offset from the center. The mic was offset from the all thread the same distance. This let me 'tune' the mic into the right position. I did it using a fixed audio source and slowly raised the mic for peak audio (I used a scope) but I beieve that +/- 1/2" is negligible difference.

good luck, Tim ka8ddz

If you're in the mood to roll your own .....You may wish to check into an old edition of the ARRL Handbook. Most of the older editions which can be found in many Public Libraries contain a chapter on inductance. The formulae for computing the coil diameter and length for various core/wire materials are there for you to complete your design. Nice to see some one still doing some homebrew.

I don't about the present capabilities of Spice, but I tried to analyze a
crystal oscillator circuit about 25 years ago and needed to write a
Fortran program using extended double precision in order to have enough
precision to handle the Q of the equivalent circuit.

: between the two signals. If, on the other hand, you are talking about
: the amplitude of the beat frequency, that is possible. Here's how. If the
: pair of signals is moving far enough relative to the IF filter, then one or
: both
: would be attenuated, causing the beat signal to attenuate, too.
: Alternatively, you are merely experiencing the naturally occurring change in
: signal strength that occurs on the SW bands.

: Hope this is helpful

: Martin, WB6YMI

Thanks, Martin.

No, my oscillator or the mixer is changing frequency. The
wavering is not a change in signal strength, its change
in frequency. Also, if the mixer/osc are changing in frequency,
the beat note will change in freq too as in all superhets.

I think I am experiencing osc pull by the NE602 mixer.
Havent pulled it out and put in another or replaced the
varactor yet. I'll post if they make any change. I did
hear some cw on the 40 metre wavelength, it was all over
the place. This thing should be pretty stable, so I
am pretty sure the MV209 or NE602 is having a problem.

See ya!

## 2194. 2-Meter

Newsgroup: rec.radio.amateur.homebrew

I am trying to find information on how to build a 2-meter transceiver
and/or a 2 meter amp. I would like to make to transceiver so that I can
join in on packet in my area so crystal controled would be fine. If you
know where I might find that information, please tell me.
Thanks a lot!

Hi,
Say, here's a BETTER idea....build a low cost, low power FM
Microphone, hang it by (on) a tree limb, bird feeder,
hummingbird feeder etc....then TAPE the results on a
cassette deck connected to an FM tuner (reciever).
friend,
Lute

:>
:>I need a suitable Spice3 model for a 7.040 Mhz FT-243 crystal. I have a QRP
:>transmitter that I am modeling in Spice. It uses a 2N3819 JFET and a FT-243
:>in the oscillator.
:
:I don't about the present capabilities of Spice, but I tried to analyze a
:crystal oscillator circuit about 25 years ago and needed to write a
:Fortran program using extended double precision in order to have enough
:precision to handle the Q of the equivalent circuit.
:
:

That was back in the days of 4, 8, ?? bit computers. Regular "float"
precision means a quite different thing nowadays. :) :)

I have a C++ program for analyzing ladder crystal filters. The complex
class math routines take 100 ms for 100 data points for each 4 pole
section, and the graphs turn out very nice with regular floating point
variables.

But then this is PowerPC cpu at 132mhz. With a fast Pentium, times and
precision should be comparable.

With oscillators and other non-linear stuff, convergence would be the
problem, but I'm no expert on that. There are entire books devoted to the
subject.

Rob.

ps. I've used Microsim for crystal filters and it does a decent job.
However, I'm told old versions were a problem with crystal modeling

Harry Hurst (hhurst@delaware.infi.net) wrote:
: Is there any information available * ANYWHERE* on constructing air variable
: capacitors?

Haven't heard of anyone attempting this, other than for
broadcast type crystal radios where 2 or more large plates
forming the condenser slide past each other to change
capacity.

Surely an imaginative mind could come up with an air
variable but would have to have a small machine shop.

If you are thinking about constructing what I think
you are (construction similar to standard 356pF)
and are successful, please..by all means, let
us know how you did it, as I am looking at someday
purchasing a small miniature lathe and other tools
to work with metal.

I don't think most of us Joe Blow from Kokomo
types working out of our garages have the capability
though to construct something like the standard
various air-variables.

You MIGHT be able to work in wood with brass
bushings and aluminum plates etc...but even
that would seem like quite a project.

I think I'll stick to just scrounging. :-)

## 2198. Low-power, small size, fm broadcaster.

Source record: 91374

I'm trying to build a small (approx. 1" x 2" x .5"), low voltage (~1.5 -
3 v),
short range (~10') stereo fm broadcaster.

I think this is the place to ask...

Can this be done?
If it's already done, where can I get it?

I've already built a mono version which works off a 1.5 volt watch
battery, but I hear
its a lot more difficult to get a stereo encoder in there.

Any help is welcome.
If I'm in the wrong group just let me know and I'll go elsewhere.

Thanks,
Mike

Not always true.

CCIR studies in the 1950's found situations at certain times of the year (e.g. winter) and in certain locations (e.g. at sea), and at certain frequencies (e.g. in the 5 to 6 MHz region) where the noie level was quite low.

I have also noticed it with rotary beams at 20, 15 and 10 meters in certain directions (e.g. due north) in certain daylight hours in the winter time. I think a lot of HF DXers in quiet rural locations would agree. The situation is characterized by low noise and very weak signals coming over the polar (north or sometimes even south) regions.

In these situations, some receivers with noise figures of 12 dB or more could benefit from the gain and increased sensitivity of a preselector/preamp and possibly even antenna tuning. Receiver overload in this unusual environment is not usually a big problem.

Harry,
Although I've never seen any info on homebrewing air variables,
there are kits available - Ten-Tec has them.

Also, there was an article you might be interested in called "Build Your Own Variable Capacitors". It involved using copper cylindars and teflon sheet, rather than an air-dielectric. This article appeared in November 1975 QST.

Incidently, you might also be interested in an excellent, modern tube regen design by David Newkik that appeared in the September 1992 issue of QST.

As the people from AoL say,

"ME TO!!!!!"

It might be possible to obtain the reprint rights for HR, but
it would be difficult and probably not cost-effective. However,
the League has deep enough pockets and controls enough rights
to be able to sell to a microfilm compamy -- could they do
a QST CD? Even though I'm aware of the problems with publishing
rights, I think the ARRL could put QST on CD. And I think
they could make money on it, too.

For the right money, I'd do the data conversion for them.

Seriously, what would you pay for QST on CD-ROM, with searchable text
and vector-based schematics and PC board layouts? It would have to
be a multi-CD set with the earliest issues done first, and
perhaps a 2 or 3 year delay between magazine publication and
CD publication, depending on how many issues could fit on a CD.

Since the complete QST on microform costs a couple hundred dollars,
I expect the price of the CDs would be higher -- probably $25 a
CD, and this would probably work out to $4 or $5 per year for the
recent years. Would you pay that much?

Answer here -- or if you think that this idea REALLY has enough
merit to convince the Main St. boys, email me at jstrohm@texas.net

First, stop shouting.

Second, the value of the capacitors is not critical, and
anything from 0.001 uF to 0.01 uF works OK, in my experience.

Third, the diode string method is outmoded, ineffective,
and prone to failure. It's something we developed to
replace mercury-vapor rectifier tubes. You'll be a LOT
happier, and save a lot of time and money, if you use
real high-voltage diodes. You can scrounge these out of
microwave ovens, or you can order them from "Silicon Alley,"
the guy who advertises in QST. No, I don't work for him.
I'm just one of MANY satisfied customers.

N6OTQ

P.S. You need to look at the cost of Silicon Alley's parts vs.
the cost of building diode strings. Real HV rectifiers are
cheaper if you're buying new parts -- maybe even cheaper if
you're only replacing a few parts in an assembled string!
And don't use the "1A 1000V" generic diodes or 1N4007. They
blow up at about 100 mA. Use the (I believe) 1N5407, the fat 2.5A
diode. Those will last longer, maybe a month or so.

Have a look at several of the home pages to do with magnetic loop
antennas. Sometimes there is information on building air variables
(admittedly a bit big) on those.

At least one of the pages I'm thinking about can be found via the links
section of Novice Notes Online - URL below.

Cheers,

Looks like the winners (scopes that work for you folks) are
TEK 485, 475, 465B, 7904, HP180 for tight budgets.

I now want to buy a used working TEK 485 or 475A or 7904 with
specific plug-ins.

I now really need suggestions where to post my needs,
what sources to monitor, vendors to call, etc.
I need name of an honest capable CAL LAB that works on these
old scopes that you folks have had good luck.

I will be checking out ATT, GE, Electro-Rent to see what they offer
from pool of equipment they have maintained, calibrated,
and now are reselling out of their inventory.

Thanks for any pointers and tips.

I wish I could send you a copy of some of my stuff via email, but I use a Power Mac for internet, and emulate Windows for running PSpice. That gives me 486 Windows performance, but I don't have any Windows internet software. Using Windows is miserable enough without adding more applications :) :)

Sorry, Rob.

ps. If you are really into this, you could send me an IBM formatted diskette and a SASE (padded) envelope, and I could copy my libraries onto it. Now this is Microsim, so there are crystal symbols, and the symbols have data fields for entering in the Cm, Q, and fc, so its all quite sophisticated and easy to use for making any circuit without alot of calculations beforehand.

If you have any questions about Microsim, you can go to their website and request a free demo CD, which contains everything including schematic capture, autorouter, mixed signal simulation, etc. And amazingly if you don't exceed 70 devices or one page in schematic you effectively get a $10,000 software package for small circuits.

# 2214. Crystal filter info

Leon (G1HSM), Tom Bruhns and I have been discussing the construction of crystal IF filters. Today I breadboarded a little oscillator so I could do some very rough checks on a batch of 50 3.579 Mhz color burst crystals (in HC-33 holders) bought (at a very reasonable price!) from Dan's small parts. I just fired up the oscillator and tuned my Drake 2-B to zero beat at 3.579 Mhz. Then I started plugging in the crystals while listening for any tone. (I know this would be easier and more accurate with a counter, but I don't have one.) I found that of the batch of 50 rocks only 6 were noticeably off frequency.

I also have four 3.579 computer clock crystals (in HC-18 holders) from Mouser. They seemed to all be pretty close in frequency, but I'm inclined to use the color burst rocks for the filter. Are there any advantages to using the computer clock crystals in this application? Anyone have any experience with this?

I'm going to follow up on your suggestions. Thanks much.

It seems to me that homebrew air caps might make an interesting project for my reentry into ham radio, although i don't have any metalworking skills.

Capacitor parts could be offered with different ceramic end pieces and plates, different length shaft lengths, and spacers. You could offer complete kits, or component parts a-la-cart to build a particular part.

Now... I happen to know where there is an old mica mine a few miles from here. I wonder if I could build some mica capacitors?....

# 2219. Re: heathkit sb 200 with kenwood ts850

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-29 00:00:00 UTC
From: Mike - WB0IKT <crucis@sky.net>
Message-ID: <34072D41.B7EC9D49@sky.net>
Source record: 91390

I had a SB-200 once---used it with a Kenwood TS-520. As I remember, The SB-200 needed an external relay to act like a PTT switch. Two pins on the octal plug on the back of the SB-200 connected to the accessory jack of the 520, along with ALC. You must be careful not to overdrive the SB-200. The input level was limited to no more than 100 Watts DC. At 100 Watts input, I used to get 600 Watts output on 80M-15M and 450-500 on 10M. I think the connection to the 850 is very similar to the 520.

There is also an excellent transistorized regen project in the Projects Section of Chapter 17 of the 1995/6/7 ARRL Handbook. This project was done by Charles Kitchin, who is with Analog Devices Company.

Announcing NEW
Ham Radio.FAQ

This is the second generation of the original file that was
a regular USENET posting entitled

"rec.radio.amateur.misc Frequently Asked Questions"

The NEW Ham Radio.FAQ is a HyperText document that is on the
WWW and it contains 3 chapters plus hundreds of LINKS to radio
related sites!

1 - Introduction to the Ham Radio.FAQ
2 - Amateur Radio Organizations, Services, and Data Sources
3 - Amateur Radio Advanced and Technical Questions

Please provide a copy of the Ham Radio.FAQ to any new or
soon-to-be Hams that you know or share with them the URL to this
site:

http://www.mv.com/ipusers/wd1v

Send me an EMAIL <or packet with your Email address> if you want the
FAQ text file sent to you as an attached <120 K> file with the words
"HAM FAQ" on the subject line.

Send me a formatted disk with SASE disk mailer if you want the
FAQ text file sent to you on disk. PC or Mac are fine.

73,

# 2223. Re: RAMSEY SR-1 SW kit

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-29 00:00:00 UTC
From: The Ronney's <pronney@sprynet.com>
Message-ID: <5u7ura$j2b$1@juliana.sprynet.com>
Source record: 91394

Hi again, Tony.

Unfortunately, I don't have any details on the Ramsey kit. I've seen them in a local store and thought about purchasing one, It seems kinda like fun. Does it have a BFO?

Perhaps I am not following you. If you are receiving CW using the kit's internal BFO, then I agree that you will hear the tone change if the local oscillator changes frequency.
It seems, however that you are receiving using the heterodyne between the CW signal and a second, nearby signal. If that is the case, the audio signal that you hear is the difference frequency between the two carriers. Another possibility is that the tone you hear is the beat frequency between a signal at the desired frequency and one being received on the image frequency.
Lets see how that works (I'm thinking out loud here):
Lets call the desired frequency Fc1. Then the frequency of the local oscillator (Flo) is, for the sake of argument, below Fc1 by a frequency of Fif (The intermediate frequency. Oh, this is not a direct conversion receiver, is it?) So, Fc1 - Flo = Fif. But, there is also an image frequency (Fc2) that can be received, which is Flo - Fc2 = Fif. As Flo drifts, say, to a higher frequency and since Fif is fixed, the signal at Fc1 will appear to drift lower in frequency while the signal at Fc2 will appear to drift higher. Thus there is a net appearance of the two signals changing in relative frequency. If the beat note from these two signals is what you are hearing as the "tone" of the CW or RTTY, then, yes, moving the frequency of the local oscillator will change the tone you hear. You seemed to indicate in your original posting that the tuning seemed to make no difference, so maybe there is little or now image rejection. Are you hearing signals on the frequencies you expect or are they also showing up at unexpected locations as well? This would indicate image frequency reception. I know it may be difficult to tell if signals are in the correct frequency locations as the dial calibration may not be that accurate on a kit like that. Another indication would be hearing the same signal in two locations on the dial that are separated by twice the intermediate frequency. What is the IF on the kit? If it is single conversion, probably 455KHz, so listen for a unique signal and then try at a frequency that is twice the IF above and below. Compare the signal strengths.

Please see my notes below, too....

>...>I have
>: drift. AM comes in fine, and
>: >being 10 Kc wide, one would not know
>: >the difference, but when CW or RTTY
>: >etc. mixes with another carrier and can

>: >be heard, these signals waver around like
>: >crazy indicating the local osc may be
>: >moving around.
I think you are saying in the above paragraph that the note that you hear is not from the signal beating with an internal BFO, but two received carriers heterodyning together. Yes?

>: >In the presence of strong AM carriers,
>: >the osc will pull and any carriers beating
>: >with the AM signal give an annoying waver.
This is a waver in what? Apparent frequency? You notice this by retuning? Is there a beat note (tone) in this case?

>: I don't have one of these kits so I can't speak about it, but...
>: If two signals are beating against each other causing an audible tone, that
>: tone won't change in frequency if your receiver drifts.
>: The beat frequency between the two signals is strictly the difference
>: between the two signals. If, on the other hand, you are talking about
>: the amplitude of the beat frequency, that is possible. Here's how. If the
>: pair of signals is moving far enough relative to the IF filter, then one or
>: both
>: would be attenuated, causing the beat signal to attenuate, too.
>: Alternatively, you are merely experiencing the naturally occurring change in
>: signal strength that occurs on the SW bands.
>
>: Hope this is helpful
>
>: Martin, WB6YMI
>
>Thanks, Martin.
>
>No, my oscillator or the mixer is changing frequency. The
>wavering is not a change in signal strength, its change
>in frequency. Also, if the mixer/osc are changing in frequency,
>the beat note will change in freq too as in all superhets.
(The mixer doesn't have a 'frequency' as such. It merely mixes two signals and creates sum and difference frequencies. In this case, the mixer is mixing the desired receive frequency with the local oscillator, creating a sum and difference frequency, one of which is at the intermediate frequency.)

>I think I am experiencing osc pull by the NE602 mixer.
Yes, that could happen.
>Havent pulled it out and put in another or replaced the
>varactor yet.
I doubt that it is the chip itself. That is, if one does it, they all will. Probably no value in replacing the NE602 with another NE602.

>I'll post if they make any change. I did
>hear some cw on the 40 metre wavelength, it was all over
>the place. This thing should be pretty stable, so I
>am pretty sure the MV209 or NE602 is having a problem.
Hmmm... Varactor tuning. Well, be sure that the power supply to the tuning pot is very well regulated. Imagine this: You tune in a station and get lots of audio signal. As the audio gets louder and quieter, the power supply sees more and less load. The power supply voltage droops when the load is high and returns back up when the load is reduced. If that same power supply is used to feed the tuning pot, then the varactor will see the same variations. So, loud signals will cause the varactor to see voltage change and tune the receiver to another frequency, which will cause the signal to go away, which will cause the signal to come back, which will repeat the process.... You've invented the oscillator! Hopefully the voltage going to the tuning pot is well regulated and that it does not share with the audio stage.

>See ya!
You bet!. Happy SWLing. 73's
Martin. WB6YMI

## 2224. ham radio help

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-29 00:00:00 UTC

# 2226. Scope from TV CRT - please don't skip :)

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-29 00:00:00 UTC
From: Nuno Sucena Almeida <slug@bbs.aeminium.pt>
Message-ID: <5u67qj$811@pc2.local.aeminium.pt>
Source record: 91397

Hello guys,

could some one point me some *information* on how to build a scope from an old TV *CRT* and other spare parts? And where can i get info about the CRT pinouts, voltages , etc ? I know it has been done and its seems easy to me but with adicional *guidelines* it would be easier to start with the project. I'm aware of the BW CRT deflection coil limitations but how much BW could I espect from a tipical CRT?
And about tipical Deflection and electron source ( the lamp:) voltages/currents and *other* info that you might think is important.

The primary use would be checking signals under 1MHz ( laser beam audio and data communications , FSK analisys , spectral analisys , etc ).
Thank you *very* much!

>be a multi-CD set with the earliest issues done first, and
>perhaps a 2 or 3 year delay between magazine publication and
>CD publication, depending on how many issues could fit on a CD.
>
>

In case no one has bothered to mention it to you, the 1996, and 1995
years of QST are available separately for $19.95 plus shipping from
the ARRL, or some dealers, if you go to major ham dealers, there
is no shipping, if you buy it there on the spot. I also note that from
1970 - 1994 is available in 5 year chunks for $39.95, which is also
a reasonable price. The single year CD include QEX for that year,
and apparently the NCJ. The conversion of the ads to black and white
does lose some of the impact, but everything is fully readable. There
were complaints on another newsgroup about the format of
the CDs, and the search tool available, but I note that anyone
with an internet connection can also use the ARRL's search tool
on the web site, and then find the proper issue to read. The
information is on the CD, one just has to search for the correct
info effectively.

From: jim@rst-engr.com
Message-ID: <34089653.5717659@news.gv.net>
Source record: 91314

wrightj@planetc.com
shared these priceless pearls of wisdom:

->How does a homebrewer plate thru holes in making oc boards?

You don't. You call a company called "Rivets Inc." in Santa Barbara CA (or some name like this) and order a thousand or so itty bitty hollow copper rivets with an 0.032 (or whatever hole size you use) outside diameter. Rivet the hole, then solder vias and hope that the components wick the solder onto the rivet when you install the component.

Or, do what most of us do. If it is a simple via, solder a short bit of clipped resistor lead through it. If it is a component throughhole, solder both sides of the board when you put the component in.

Plating copper into the holes is a real bitch. Most of us that have tried it at home have not met with great success.

Source record: 91315

hi Bob,

what kind of synthesizer PLL chips are available and where
can I buy these?

I have only been able to buy MC145106 and MC145151 chips.

I seem unable to locate any of the better synthesize chips
like MC145170-1 etc.

Using the timer as PLL synthesizer would definitely
reduce the "where to BUY" problem. These timers can go
to 20-30 MHZ in several popular versions of 8051.

:Anyone have any experience with this?
:
:
:73 Bill N2CQR

I'd just pick the ones with the highest Q. An easy comparative measurement
can be made by putting the crystal between two pi attenuator networks. The
signal generator connects to the input of one network, and a scope or rf
voltmeter to the output of the other.

Make the pi attenuators, say 6db at 50ohms (12.5ohm is standard for crystal
test fixtures). Keep the signal generator at the same level for all tests.
Then just put your crystals in the test fixture, tune the sig gen for
resonance with each crystal, and pick out the crystals that give the most
output at resonance.

You can also just keep the sig gen at one freq and put all the crystals
thru to pick out the ones closest in fc, but thats usually only important
for narrow CW filters.

Rob.

Source record: 91400

Hello All, A friend of mine has discoverd an unusual problem with his FT-290R mark 1.
At first switch on, the S meter goes full scale, the TX has low power and poor rx. sensitivity. This would suggest a drop in PLL output, but so far has elude him (and me). The fault slowly gets better after a few minutes.
As a cross check Ipulled my ft-290R out and was about to measure various levels around the PLL area, to my horror discovered mine does exactly the same thing, well almost, my s meter goes to 3/4 scale.
Anybody found the cure for this, it really has us beat as the fault goes away after a short time, until switch on the next day.
Peter VK4AWP

## 2238. Collins 312B

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-30 00:00:00 UTC
From: Mack McLaughlin <kf4mir@panama.c-com.net>
Message-ID: <01bcb4e5$f5ed2080$95835fcc@dialinxx.phoenix.net>
Source record: 91401

(I have posted this note to two other groups, so if you have read this, please disregard...thank you.)

I have recently inherited a Collins 312B Station Control box that I would like to hook up, but I am not sure exactly how. I run nets from my location often and would very much like to offer 2 way phone patch capability.

This is an old unit, so it is not just as easy as running it inline to the antenna and simply plugging a phone line in. I have an Alas 210 that I will be connecting to it.

What I need to know, is exactly how to hook it up and operate it. The connections on the back are as follows:
Coax in and out ( I can figure this much out! <g>)
Anit vox in (1/8" connector)
Anit vox out (1/8")
Audio in (1/8" 4 ohms)
PTT (1/8")
Phone patch out (1/8")
and Phone line screws (2).

I would appreciate the advice of anyone with experience that could help me.

Thanx.....Mack
HP1XBG Ft. Clayton, Republic of Panama.

## 2239. Help Identify Diodes

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-30 00:00:00 UTC
From: gwilljo@cwo.com
Message-ID: <5u88ot$gh8$1@bigdog.eli.net>

Cross-posted to: sci.electronics.components,sci.electronics.repair,rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew,rec.ham-radio,rec.radio.amateur.equipment,rec.ham-radio.swap

Salvaged the following diodes with associated markings, but can't find specs:

HI Q CK72AX 102M

FRIE CK80AW 102M 1000

M MR2901S 7426

IN3209 SI 7412

IR X5M4

Can anyone identify or give me specs i.e. Hi current, UHF.

Have old 1956 ARRL but they are not listed there either.

Thanks
Greg KB6WKW

# 2243. Switching Mixer using DMOS 2N7000

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-30 00:00:00 UTC
From: "P. Singh" <screwed@nospam.net>
Message-ID: <3407E6BF.5986@nospam.net>
Source record: 91406

DMOS switching transistors like 2N7000 or 2N7002 are available
cheaply from DIGIKEY etc.

Has anyone thought about using these to make a switching Mixer like
Calogics SD8901 or Silconix SD5000 FET quads.

I guess that mismatch among a lot of 2N7000 FETS should not be a big
problem.

Does anybody have any experience using these DMOS FET QUAD mixers?

Thanks for your help!

(PS:I dont think that I have ever seen a SD 5000 in my life OR
will ever be able to buy one. So, the 2n7000 might be the only way
I could build a switching DMOS FET mixer.)

The 485 in particular is a great scope -- I much prefer it to the clunkier 7xxx jobs (only use my 7834 when I need its storage feature or a specialized plugin.) Its 350 MHz spec is ridiculously conservative; mine is 3 dB down at around 400 MHz, and is perfectly usable with rock-solid triggering at close to 500 MHz. Its only real drawback is a screen phosphor that's susceptible to secondary emission (blooming) at moderately high intensities. This is a reasonable tradeoff for a bright, clear 1 ns/div sweep rate, though.

You'll want to look at the various advertisers in Nuts & Volts magazine (they probably have a Web site that could be found via Yahoo, etc.) You can buy a clean 485 with a limited warranty from Tucker Electronics up in Garland, TX (www.tucker.com), but you'll pay 2x - 3x the "street" or "hamfest" price for the privilege. I think Tucker gets around $1500 for the 485, but I was lucky enough to find a "broken" one being sold by a guy on Compuserve a few years back for $350, with two brand-new probes. It was well worth the 25-cent transistor and 2 hours' troubleshooting time I spent fixing it up.

If you don't need the extremely high bandwidth of the 485, you can get essentially the same feature set in a 60 MHz 453 for less than $150-$200. 453's and 454's (150 MHz) are easier to find than the 485, have what are unquestionably the finest analog CRTs ever built, and are somewhat easier to troubleshoot due to their lack of exotic custom ICs. Personally, I have never understood the appeal of the 465/475 models -- their CRTs are lousy compared to the 453/454 models, they are much more expensive, and they offer only slighly higher bandwidths. I would recommend either a 453/454 model (the 453 is all solid-state and is preferable if you don't need the extra bandwidth of the 454's Nuvistor-based front end), or going all the way up to the newer 485. Buy a 77xx/78xx/79xx only if you genuinely need storage or plug-in capability.

Hi,

People have already used the microcontroller like "PIC "
as frequency counters.

I was wondering if it would be possible to use the timer
of microcontroller as the divide by N counter of a PLL
synthesizer. Yes, I would need an external phase comparator,
BUT, microcontrollers and phas comparators are both easier
to find that synthesizer chips.

Thanks for any ideas/pointers

# 2249. AM Radio Reception Questions

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-31 00:00:00 UTC
From: Kin <kng@pacbell.net>
Message-ID: <01bcb5ae$3bdbf8a0$e001aace@kinsnt>
Source record: 91321

The reception for AM radio in the high-rise building I am working in is terrible. I would like to hear any suggestions as to how to solve this problem.

Problem: Radio reception is bad in cubicles because of interference from Computers and normal office equipment. But receipt near the building Windows is OK. In my cubicle, the reception is extremly noisy.

Goal: Listen to only one AM radio station.

Possible solutions:

1. Put an AM radio near a window and run a long long long wire to my cubicle. This is not very practical.

2. Put a custom AM radio near a window and rebroadcast the good reception into FM and receive the FM broadcast in my cubicle. Do I violate any FCC laws by doing that?

3. Build an extremely and highly selective AM radio. Anybody have a schematic?

Any more suggestions?

Kin

Want mint PS-7 power supply, junker L4PS with good transformer, junker L7PS with good transformer, and perhaps spare parts for 7 line depending on cost.

For sale:
Upgrade/replacement parts for L4PS and L7PS. Higher capacity caps, higher rating diodes, new equalizing resistors, new ALC resistor (30 watt, not 7 watt that blows the unavailable ALC pot on the L4B), plus ball bearing muffin fan. All new components, shipped priority mail conus $115. The caps alone, 200 mfd not 250 mfd like I have, run over $160 at 1994 prices, if you can find them.

Also can provide copies of service manual for TR-7, general coverage transmit/recieve mod, VLF mod, and copies of owner's manuals for TR-7, L-7, MN-2700, keyer, patch, speech processor, etc. $21 priority mail conus.

Hmmm, didn't you post this 6 months ago? A highly selective radio is not going to do the trick for electrical interferance.

Can you get an antenna near the window? Not knowing how much your company will permit makes it difficult. I'd talk maintinance into running a pair of wires to the window, put the radio in the window an then plug into the phone jack or get inside and disconnect the speaker then run the audio only to your cubicle.

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Hello All,
I've just bought one of the above radios at a rally and was
told enough about the keypad programming to determine that the set
works OK on it's original 450 - 470Mhz channels.

I now want to mod it to the UK 430 - 440Mhz amateur allocation and
wonder if anyone has done this before? Simple re-tuning doesn't look
like the answer as the local oscillator gives up before it gets down to
the 70cm band :-(

A web search has drawn a blank - even on the "Cleartone" company! - so I
wonder if anyone out there has wrestled with one of these sets before?

TIA,

Eric

> Terry/WB4FXD in Ft. Lauderdale

You do not need an external voltage to operate the antenna relay
in the SB-200, that is provided in SB-200. There is an RCA phono
jack on the back of the amp marked 'ant relay'. On the back of the
TS520 is an octal socket marked 'remote'. Pin 5 of this socket is the
normally open contact
of the transmit/receive relay in the 520. All you need to do is connect
the a cable from the 'ant relay' of the SB-200 to the remote socket
on the 520.
When the 520 is placed in transmit mode, this will close the circuit
and operate the antenna relay in the SB-200.

Source record: 91332

Someone was looking for suggestions on an RF millivoltmeter
or RF power meter ...

Laurens, M1CCO said:
> I'm thinking of building something using the LT1088 or
> AD736/737 chips (TRUE RMS power meter chips, up to
> 300 MHz, but can't find the data sheet)

The datasheet for the AD736/737 are available at:

http://www.analog.com

HOWEVER ... the 3 dB bandwidth for sine wave input varies from
5kHz at 1mV rms input to 460kHz at 200mV rms input ... NOT
very useful at 300 MHz ...

The LT1088, however, IS spec'd to 300 MHz 3dB, but only to
100 MHz with 2% accuracy ... this would appear to be a
potentially more useful part ...

�300MHz 3dB Bandwidth �1% Accuracy DC-50MHz �2% to 100MHz
�Bandwidth Flat Over Input Voltage Range �50:1 Crest Factor
�20:1 Dynamic Range �35V Peak Input �Thermally Based Operation
�Fully Specified Thermal and Electrical Parameters �Standard IC Packages
�Resistive Inputs
(data from http://www.liinear-tech.com)

Thanks to all for reading this one.
I own a Kenwood TH75E biband walky, with the original European coverage (144-146 and 430-440).
Someone knows about the procedure for opening this limits, at least in reception?
Best regards from Juan, EA4ALZ

>Try ne612 (philips) it's the same part..

Not quite so.

The NE612 is functionally equivalent to the NE602, and is pin
compatible, but it has a slightly lower performance.

I think this applies to the noise figure , 5 dB for the NE602 vs 6 dB
for the NE 612. The conversion gain at 45 MHz is also lower, the NE602
has minimum gain of 14 dB, and typical gain of 17 dB. I don't recall
the figures for NE612, but I think it is a few dB worse.

I think you might be interested in the Analog Devices AD-640. I use a pair of them in a log detector and have a succesful duplication of their design in the data sheets. I can see -70 with ease, -75,-80 with a little imagination. If you're willing to narrow up the bandwidth a bit, to limit the noise, you can do better than that. Mine are linear in dB at 0.5 volts per 10 dB within a millivolt all the way.

What you want should be available in your department store.

I bough mine from century 21 in NYC.
It is called the SOUNDFEEDER wireless FM stereo transmitter.
It works off one 1.5 volts DC AA cell and has a built in
stereo encoder.

The manufacturer seems to be Arkon Research Inc, Arcadia CA

Hi Tom--

My understanding is Philips is discontinuing DIP NE602 (I'm not sure about the status of the NE612). However, the AN602--the Mil Spec version of the NE602, will continue to be produced in DIP packaging. If you find the NE602 to be unavailable because distributors can't get them, use the NE612 for non-critical HF work and the AN602 for more demanding applications. The AN602 is also available in SMD.

Man Bites Old Brown Dog!

9/1/97

Hi, there. My name is Peter Egelston. I am President and principal owner of Smuttynose Brewing Company, a small craft brewery located in Portsmouth, New Hampshire (for those of you who may not be familiar with us). We are a small company (fewer than ten full-time employees) whose products - Shoals Pale Ale, Old Brown Dog Ale, and Chuck Wheat Ale - are distributed throughout New England, with smaller spot markets along the eastern seaboard and the midwest. Our sales for 1997 will be approximately 6,800 barrels.

Earlier this week, I made the decision to let my sales manager go. Because as an employer I am legally obligated to protect the privacy of this individual, I am not able to discuss the precise circumstances that led up to his departure. Suffice it to say that this was a difficult decision that I felt was necessary for the long-term benefit of the company.

But let me get to the reason for this posting. It came to my attention this morning that the story on the street here is Portsmouth is that my former sales manager was let go because he refused my directive to sell a batch of contaminated Old Brown Dog. Although several variations of this story are floating around, they all share that basic point. I must say, the story is effective in that is simultaneously attacks my company's and my personal reputation, both of which I value highly. Furthermore, it exploits the fact that as an employer, my response must be extremely cautious and measured.

I thought long and hard before deciding to address this publicly - it's like responding to the question "When did you stop beating your wife?" - the fact is, we at Smuttynose can't win. Deny it or ignore it - the damage is done.

But I have to go on record and say that this story is patently false. We are a small company struggling to survive in a difficult market full of larger and better financed competitors. The good will we have received from our customers has been well fought for and, in my opinion, well deserved. We do not deserve to be slandered like this. Like many small breweries, Smuttynose Brewing is comprised of a small number of individuals who are deeply dedicated to making great beer. We must make up for our lack of financial resources with hard work, creativity and persistence.

This particular accusation hurts especially, due to the fact that last spring we did have a batch of Old Brown Dog that went bad (a lactic infection, for the record). We recovered most of it before it hit the market, but several hundred cases found their way into the hands of our customers, and it cost us dearly. While we have taken that setback as an opportunity to do some soul-searching and to make some serious improvements in our quality control, the incident will haunt us for a long time.

Now we are faced with a disgruntled ex-employee trying to exploit this for the sole purpose of exacting some sort of revenge for what he perceives as a wrong done to him. This is beneath contempt.

It hurts to have to go public with this, yet, reluctantly, I feel that some sort of response is necessary. As I began this posting by saying, we are damned if we do, and damned if we don't. I am confident that we will come out of this better off than before. Certainly, I get some grim satisfaction in feeling justified after the fact for making the decision I did.

Feel free to respond to this posting, or email me directly with any feedback you may wish to share.

If you wish to learn more about us, warts and all, visit our website, which is still under construction but is now accessible at:

http://www.smuttynose.com

Thank you.

You can get stuff like this all over the place. I'd try Digi-Key, Mainline and Future/Active in a first round of phone calls. Have you contacted your local Motorola distributor? What did they say?

Microcontrollers are still handy in these situations, to feed serial programming data to the PLL chips.

Right... so? I am sure it's a big problem for packet, but most of us
using Dow-key relays want them for tube xmtr projects and there it is
not a sesrious problem really!

Contact Bruce, W6TOY in MD or Mike Czuwaczewski (SP?)
They both know a lot of QRPers who have done this kind of thing.

You can e-mail W6TOY at: Muscolino_Bruce@tmac.com
He can refer you to the right people. I met with several of these
"Maryland Milliwatters" guys who build stuff in the altoids boxes
and Mike was even working on building a QRP TX in a fuse box!
(One of those little ones that holds 5 Buss AGC cartridge fuses!)

These guys are really into building miniature QRP stuff.

Enjoy!

AND, take a look at:

There is a ham store in Nashville too - MADISON, TN to be exact.
Just off the main drag, a block south of Madison Church of Christ,
in a row of shops on the WEST side of the main street. Look for
antennas. Ask for MIKE.
I forget the name of his store.

Years ago it was called ARSON (Amateur Radio Supply of Nashville)
before he owned it. They had the corny ads in QST - "We're burning to
make hot deals!"

Groan!

> to me

Hello Nuno,

Many years ago, I built something like this. I'm sorry that I no longer have the plans, but the general idea was to use the entire old TV, not just the CRT. An extra deflection yoke was required. Basically all you do is disconnect the horizontal deflection circuit from the TV's yoke and instead wire it to the corresponding terminals on the extra deflection yoke.

Then use an audio amplifier (perhaps the one from the TV itself) to apply audio to the horizontal terminals on the TV yoke.

So now you have a TV which:

* Still has high voltage to the CRT, because the horizontal output is connected to the extra yoke (most TVs derive their high voltage from the horizontal circuit).

* Sweeps vertically at the normal rate

* Deflects horizontally in response to audio input.

If you want, wearing safety goggles etc. you can loosen adn gently rotate the yoke 90 degrees so the sweep will be horizontal on the face of the tube.

The result is a large screen "horror movie" oscilloscope. It is not terribly linear, and accurate measurements are not really possible. But it will provide some indication of a signal.

Maybe one could design and build an accurate sweep generator to use instead of the TV vertical sweep... but by the time you did this, you'd proabbly have the cost of a used 'scope plus a whole lot of time invested.

Besides being VERY CAREFUL when working inside a TV... the CRT can hold a high-voltage charge long after the set is turned off... please be

aware that I was working with 1970's vintage TV sets. This should work with modern TVs, but I have not tried it. It would be best to have a schematic of the TV handy for reference if possible.

Good luck, have fun...

-john

The computer supplies I have actually measured (2 of them) were a true
12 Volts. A nominal 12-V battery has a resting voltage of 12.6 to 12.7
volts, needs about 13.2 V for maintenance charging, and needs over 14 V
to recharge.

The computer supply is not adequate. Besides, most can't deliver enough
current. I run much of my equipment off a deep-cycle battery. After
about one minute of transmitting using my 20-Watt 2-meter rig, the battery
draws over 2 Amps from the charger.

I built one of these about two years ago.
My memory is fuzzy on it, but I recall having the
same problems. I added and extra 0.01 uF
bypass caps on the +V trace near U1 and U2,
0.1 uF and 6.8 ohms in series from the
output to ground (provides high-frequency
roll-off), 0.1 uF and 1500 ohms in series
from the output of the 602 to ground
(similar purpose), and two other 0.01 uF caps
for reasons I can no longer remember. These
mods made the receiver much tamer.

> I dont see much change in the tuning
> slugs of the RF, IF and OSC cans unless

Mine have a clear effect. Maybe you'll see
more if you try the mods.

> I have drift. AM comes in fine, and

For sure. When you try to extract as much
tuning range from one oscillator as Ramsey
did, you get drift and some instability.

> In the presence of strong AM carriers,

> Thanks in advance,
>
> Your pal Tony

If you've got the parts, experiment. It *is*
only minor surgery, and you should be able to
restore the receiver if you don't like the
results.

But I wouldn't expect much. If you want
noticeably better performance, you'll need
better up-front filtering (which Ramsey's
80/40-meter kits have), and less tuning
range (ditto).

# 2285. TEK Probe parts

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-01 00:00:00 UTC
From: Jason G Skalski <jskalski@acsu.buffalo.edu>
Message-ID: <340B4539.549F6123@acsu.buffalo.edu>
Source record: 91354

Does anyone know a source of parts for TEKTRONICS probes?

I have a TEK P6131 that needs a resistor element. It is a screw in deal
that looks about the width of a metal ink pen refill and has stainless
steel pins coming out of each end. It is situated between the handpiece
and the removable grabber attachment.
The probe is 10 Megohm it is used with a 100Meg scope.

Any leads would be appreciated. (pun intended)

Hi Rich,
Yeah, they are everywhere and cheap...but they won't charge your bloody
battery worth a damn, and they are NOISY as all get out. They are
switching power supplies and thier clam to fame is how cheap they are
and the fact that they work at all. Find a decent linear power
supply...or a battery charger and run it only when off the air to
recharge the battery. That's a better way to go.
friend,
Lute

This isn't what you asked for but just in case. There are some interfaces out now that will let you use your computer for an O'scope. Some of the cheaper ones are under $100 and would be much better than the TV. A handheld LCD display scope can be had for about $120.

# 2289. For Sale TE Systems 0550G 10 in 375 out 59 Amps

I have a like new condition amplifier. It will do about 370 watts with about 12 watts in. It has very little use and is in new condition. Will take $375 shipped . The amplifier is close to $500 new. Works, and sounds very clean on SSB.

>(PS:I dont think that I have ever seen a SD 5000 in my life OR
>will ever be able to buy one. So, the 2n7000 might be the only way
>I could build a switching DMOS FET mixer.)

What is the problem? You can buy them single quantity with no minimum order from Tech America, 1-800-877-0072 for under $5 each. They also have the SD-5001, same die lower permissable drive but eminently better than diode rings in the drive required for a given Ip3. The price for that one is just over $4. single quantity, under $4 for 10 -99.

I have mixers using the 5000, and aside from ticklish on the initial balance, they are phenomenal.

Check out the new Web site for San Francisco Liberation Radio at 93.7 FM. We broadcast seven afternoons and evenings a week without license from the government. We feature revolutionary music, radical talk shows, uncensored news, and children's programs--the kind of programming that you will not hear on government licensed radio stations. The Web site contains a weekly program guide complete with program notes written by our broadcasters, who specialize in topics such as social justice, government corruption, the environment, animal rights, poverty, homelessness, police brutality, prisoners' rights, etc. Locally produced original programming! No commercials! No corporate support!

It's a shame things like this can happen so easily. One of the risks of being one of the people trying to bring the craft back to brewing, I guess. As a fan of your beers, I recommend them highly, and will continue to do so.

BTW, the pubs in Northampton and Portsmouth are among the coolest, too.

Keep Brewin'

Actually, it is possible to increase the voltage of these
bloody noisy computer supplies just by changing the value
of one resistor in the switching controller circuit
( LM3524 or equiv.)

This resistor will be in the 5.0V feedback loop to LM3524.

I remember having done that years back.

Yes, it does work OK for a lot of uses .

You will have to turn it off and let your rig run of the battery
once the battery has charged , as, these supllies are definitely
NOISY.

## 2301. PLL and DDS plans

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-02 00:00:00 UTC
From: klettke@cnx.net
Message-ID: <340b7273.3025818@news.cnx.net>
Source record: 91273

I ordered plans for a PLL and a DDS frequency synthesizer from a Texas company, I got the info and address on the internet; I have now waited 8 weeks and received nothing. I have lost the address and the internet address (good record keeping).
If any of you know this company please email me so I can correct the errors.
Thank you
Duan

Use strings of 8 diodes with equalizing resistors and caps in 2kv 1 amp
power supply, no problems for 2 years now. Normal current draw is about .5
amp.

## 2304. Okay, I get the picture!

Pete,

I was at Smutty Nose this summer and loved it. Got loose enough to buy 3 cool tee's as well. A funny story related to your "bad batch" goes like this.

2 Friends and I were out one night at local Brew pub. We started thinking "wow, better go home" So away we went...only to imbibe more beverage upon return. Soon, no beers remained...except one smutty nose. I said" Hey Darrick, what about that Old Brown Dog, I was in portsmouth this summer and it was great. Smiling he says" Naw, its bad. "
"Bad" says I "Smutty Nose is GREAT!!!"
"well, this is different, this is the penalty beer. But you can have it if you want..."
What a deal, I thought, Darrick is a drunk ninny and does not know what he does giving me the last Brown Dog. SO I TAKE IT!!

And it tasted like rotten lemonade if I recall correctly. No beer taste at all, just pure sour and bitter and rot.

Well, needless to say Darrick and Rick fell down laughing at my reaction.

However, I still havent found out what happened to the last 5 penalty beers that they had...hmmmm

BUT just like those Burger King Triple Cheese Addicts who fear no eboli, I am right back on the Smutty Nose Bandwagon. Havent had a bad batch since...in fact that one bad taste was worth all the good stuff out there now.

Keep on brewin

>
> Thanks
> Greg KB6WKW

Hi Greg:

I think the first two might be capacitors. The values being 102X10^-6. The second unit having a 1KV rating. The manufacturer is likely ERIE (not frie).

MR usually indicates Motorola Rectifier. "M" is the Motorola symbol. The 7426 and 7412 are date codes interpreted as 26th week in 1974 and 12th week in 1974.

IR was International Rectifier. The X5M4 is likely a proprietary designation.

I hope I'm not a source of too much confusion for you, Greg.

73,

Gary, K9HDU

Perhaps it's not the yeast, but the type of hops they are using, or the use of corn sugar...
according to the German Purity Law, It can only contain Malted Barley, water, yeast, and hops to be called beer. Also, most German beers use German strains of hops. It might be worth experimenting (in small quantities) to see if it is just German Pilsners or German Beers in general. If it turns out to be German beers in general, then perhaps homebrewing is for you as you control what goes in your beer.

# 2312. ## Need RFI help: Symponic TV/VCR Problem

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-02 00:00:00 UTC
From: wb4lnm@aol.com
Message-ID: <19970902110601.HAA20019@ladder02.news.aol.com>
Source record: 91284

I have a Symphonic TVCR13B1 combination TV/VCR (that has been talked about much on this forum). Problem: The switching power supply that stays on at all times when the unit is plugged in creates SIGNIFICANT radio frequency interference to my amateur radio HF receivers. Enough so that I have to unplug the TV when I am operating, which with this TV, causes it to lose all of its channel programming. The interference is coming in via the HF radio antenna, not via the power line of the HF receiver.

Some time ago, I placed a standard Corcom RFI line filter module in line with the sets normal power cord, but had no success in reducing the interference. I also tried taking a one-half inch diameter by ten inch long ferrite rod and winding the line cord around this, which did not seem to help, either. It is very difficult to tell if this noise is power line conducted or radiated directly from the set. The schematics indicate that the TV has two sets of line filters (L1001/C1001/C1036 & L1012/C1040). I hate to go to the step of building shields for the PS if it is not really radiated from the board. Does anyone have any thoughts on reducing the RFI at the source (unplugging it is sometimes not an option!). Given that this set has a semi-hot chassis, finding widespread really good grounding points is difficult.

If so, please respond here and / or to : WB4LNM@aol.com

Thanks

John...

> Terry/WB4FXD in Ft. Lauderdale

You are right! The T/R relay in the amp is tied into the bias circuit. The open circuit voltage (when the relay in not closed) is around 150 volts DC. Most modern transceiver control circuits (relay contacts) are NOT rated for this voltage. You must add a relay, an optical coupler, or something to keep this voltage off the transceiver.

That may be true with the 820, I didn't pay enough attention to the header and thought for some reason, he was trying to hook it up to a 520. I have been using the SB-200 with a 520 for some time and haven't had any problems with the switching. Need to stop reading this stuff so late at night.

Source record: 91288

John,

Saw your post on TV/VCR. You might try putting the entire set in a shielded enclosure (refrigerator?) temporarily with it plugged in. Even one of those large pick-up truck tool boxes would work. I don't think it would fit in a filing cabinet drawer.

This would aid in determining whether it was radiating direct or through the line cord. If thru line cord, use a ferrite doughnut to act as rf choke. If direct, you can then try to shield the offending components, leave it in the icebox or build a screen room for it!!

Seriously though, there is one good point: at least it is not the other way around and it DOESN'T belong to your neighbor. You can control things somewhat.

Another idea. You mentioned the lack of suitable grounding points. Why not replace the line cord with a 3 wire cord? Just be sure the outlet is really grounded. Good luck.

Bill

A station like that would be better off skipping radio broadcast
altogether and instead putting all of the programming on Real Audio. That
way, anybody in the country with a cheap computer and a modem can hear it.
As we all know, there are no regulations for the net just yet.

No they are still here but it is about to get really crowded with all the new short haul
data links being set up. CAA is looking at interested party submissions on moving the pay TV,internet acess and video conferencing services up to 23.85-25.85GHZ. It will bring the dish size down to approx 12 inches which will be pleasing to almost everyone and every council across Australia,who were worried we would wind up looking like a lunar base station. Should be good when it happens. Cheers John

Source record: 91294

Hello group,
Does anyone know where to buy high voltage door-knob
type capasitors? at reasonable prices?
Looking especially for 67pf - 7,5KVDC
Suppose they are made by HEC as these letters are
printed on the capasitors.
Tnx in advance.

---

Mr Moron's page or MYCAL's web site both have J-Pole plans...They are easy to build and tune...but you gotta' take your time when tuning. Basically it goes like this. The "J" has a little extra length down the backbone, that is your mounting only. The coax ground feeds the small part of the J, the coax "hot" feed the long part. Start with the two in opposition along those lengths, then "tune" only the "HOT" lead, up or down to get a close match. Then tune the long "J" pole up or down for a closer match...then re-tune the "HOT" lead...etc. etc. It works quite well.

Oh, the web pages...try WWW.DEJANEWS.COM for articles by/about those sites, you'll fine 'em. If not, e-mail me and I'll dig 'em out for you.

fiend,
Lute

# 2325. Old chip data - LM3075 and LM3053

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-03 00:00:00 UTC
From: rburden@student.ecel.uwa.edu.au
Message-ID: <340e615d.5404807@news.uwa.edu.au>
Source record: 91297

Hi all,

I have an old VHF commercial radio which I thought could serve as an IF system for a 'cheap' spectrum analyser if one of the IC's had a signal strength pin.

Does anyone know what a LM3075 or LM3053 is? I checked the National site but these weren't found, no doubt to their age :)

Thanks in advance

Richard

NTE semiconductor list the NTE 724( Diff.Casacode Amp) as cross reference
for the LM3053H (8 lead metal can), and the NTE 723(FM sounds sys.) as a
cross for the LM3075. You can go to thier Web site and take a look.

Source record: 91302

What you want is a 3089 chip. Use the "S" meter pin for an analog output.
It is nearly logarithic and useful as a spectrum analyser display. K7RR

Erie also made semiconductors back in the 60's-70's, but I couldn't
find this one on their pages in some old catalogs of that vintage.
(So did a lot of companies that don't seem to exist any more like
Hoffman, and Sakes-Tarzian).

Hi,
I'm wondering if anybody has had any experience with this kit, i.e.
its design (IF filter etc), performance (e.g. stability) ?
Any comment would be appreciated. Thanks.

Hi Zack--

>I've used the SA602 as a replacement, as well as the SMD
version, but haven't seen the AN602 yet--Zack W1VT

You are 1000% correct, and I apologize for handing out an incorrect number (must have been thinking application note at the time). The SA602 is, indeed, the correct number for the mil spec version.

Source record: 91312

hi :,

Yes, I did build this kit.
These are my observations regd it:-

1. XTAL filter is very wide and badly designed.
Substituting an conventinal ladder XTAl filter
where the XTAL are in series rather than shunt
improves it a lot. Also use 32 pf shunt caps
between xtals.

I really never found out the reason for the
funny ladder XTAL filter with shunt xtals
as used by DANS centennial kit.

2. VFO does drift a lot. Could use TC.

3. Could use alot more audio rolloff to reduce all thos
high pitched tones.

4. An simple audio AGC around the first LM386 audio preamp
helps a lot.

Yes, I was able to get this thing up and running tolerably
ultimately. It is sensitive enough for 80M but I would not try
to convert it to 20 M or so as this thing has no IF amp.

I think that this thing could use a good simple synthesizer
using MC145106 and a microcontroller. I am currently working
on the same.

If you decide to build this kit , let us know how it goes.

Why split hairs? For a very few lucky individuals, HF reception is
indeed limited by receiver noise at certain times of the year. For the
vast majority, it is limited by atmospheric noise.

P. Singh;

Have you found a source for the 145106 where you don't have to buy a minimum order? I tried Motorola in Toronto for a sample, but I guess my technique needs some work.

e-mail me direct, I haven't your e-mail address. (Unless your domain really IS screwed.net)

I have at least 50 HV current or voltage sensing transformers. They measure 5" x 6" x 7" tall with two 3" long porcelain feedthru insulators sticking out opposite sides. Also has a 4-terminal barrier strip on top. I de-potted one of them using a small heat gun but only found three small toroids, a diode bridge and small cap. and lots of glass marbles and resin. The case itself is 1/8" thick solid aluminum plate with a 1/16" thick gray rubber coating on inside and out ( the top is removable ) and may be useful for housing your own HV project if you can economically de-pot the inside. The feedthrus have 1/4"-20 x 5" long long solid copper threaded studs with brass nuts on each end. Unit weighs 16 lbs. Asking $7.50 each or 3/$20 plus shipping from S.E. Alabama. Email or call 334-347-5281.

Peter,

I've recently purchased a new (for me) Schematic/PCB/Router package
called Eagle by CadSoft for my use at home. I also purchased a 5 seat
license for my group at work ... it's very impressive, especially when one
considers it costs a small fraction of others like Orcad, MicroSim, etc.

Check out http://www.cadsoftusa.com/ for a downloadable demo ... take
the time to play with it a bit and see what you think ... I think you'll be
very
surprised at how much you get for the price.

I am not affiliated with, nor do have any financial interest in, this company
..
I'm just a happy customer ...

Message-ID: <19970906032000.XAA27093@ladder01.news.aol.com>
Source record: 91235

Benjamin,

The easiest way to convert the radio to the ham range is to get a service manual for it and, in the parts list, those parts which change in the various ranges are all listed with their values for each range. The Micor manuals are still available from Motorola. Possibly a bit pricey, but will give you all the info you need. You can order through the National Parts Department at (800) 422-4210 and give them the model number of the radio. FYI, the model number for a mobile wll begin with a T followed by a digit which represents the power level, followed by a 3 for VHF or 4 for UHF. i.e. T43RTA1234 (bogus model number) or T44RTAxxxx. Hope this is of some help.

Regards,

Paul Sexauer
Sr. Systems Engineer
Motorola, Inc.

> I remember seeing article about making a j-pole out of copper
pipe, does
>anyone happen to have the article or know how to make one?

>if so please reply

Hello, Mike - n3bsq

Why not make a Better J-Pole ?
No Tuning required, Nothing to adjust or get out of adjustment.
No open coax to get water in. (SO239 Connector)
Low VSWR, W i d e bandwidth, No Balun required.
And it won't turn green.
Can even be made as a true Dual Band J-Pole.

Here are the instructions for the Better J-Pole.
Remember, the spacing is important, If you use any element material
other than what is shown here, you may have to change the spacing
to get a low SWR.
Please e-mail me, and let me know how this works out.
and let me know if you have any questions.
You may want to print the page showing the J-Poles at....
<A HREF="http://members.aol.com/Arrow146/index.html">Arrow Antenna</A>
or
http://Members.aol.com/Arrow146/index.html

Construction Plans for the Model J146 2 Meter Solid Aluminum J-Pole

Parts Needed:

Radio Shack # 21-961 3/8&#65533;-24/SO239 Mount (Mobile CB Antenna)
Radio Shack # 15-826 TV Mast U-Bolt Clamp Assembly
About 80 inches of 3/8&#65533; diameter Solid Aluminum Rod.
5 1/2 inch piece of strut angle Aluminum 1 1/2&#65533; X 1 1/2&#65533; X 3/16&#65533; Thick.
2 Stainless Jam Nuts 3/8-24 thread

Tools needed:

Drill Press with drill Bits up to 1/2&#65533;.
Tap & Die for 3/8-24 thread.
Sander or file to de-burr the cut edges.
2 9/16 wrenches & a 3/4 wrench.
Vice-grips

Make sure the piece of angle Aluminum is exactly 5 1/2 inches long.
Drill 2 1/4&#65533; holes on one side, centered to fit the U-Bolt for mounting.
On the other surface of the angle

Measure in 1/2&#65533; in from each end and drill a 1/4&#65533; pilot hole.
This should give you 4 1/2&#65533; from center to center of the two holes.
Redrill one of the pilot holes to 11/32&#65533; Then tap the hole with a 3/8-24 Tap.
Redrill the other pilot hole to 1/2&#65533;
Finish as required.

Cut a piece of the 3/8&#65533; Aluminum rod to about 59&#65533;.
Attach a vice-grip to one end.
Using a 3/8-24 Die cut in about 8 threads in the other end.
Screw on the Coupling Nut that came with the SO239 Mount
Tighten as much as you can.
Measure the rod & coupling nut & cut to exactly 57 1/2&#65533;

Cut a piece of the 3/8&#65533; Aluminum rod to about 21&#65533;
Attach a vice-grip to one end.
Using a 3/8-24 Die cut in about 14 threads in the other end.
(If you don&#65533;t have jam nuts, cut enough threads for 2 nuts & the thickness
of the angle bracket.)
Screw on one of the Jam nuts & tighten as much as you can.
Measure from the bottom of the nut and cut the rod to exactly 19 1/4&#65533;
(Remember the nut must be included in the Measurement.)
(Put a small amount of grease on the threads)
Screw the element into the threaded hole of the angle bracket and tighten.
Screw on the other nut and tighten it.
Attach the 57 1/2&#65533; element in the 1/2&#65533; hole using the rest of the SO239 Mount.
Mount & test your new antenna.

SWR should be less than 1.2:1 at 146 MHz and
less than 1.4:1 at 144 &148 MHz.

This Model J146 is available from Arrow Antenna for only $ 35.
The J146/440 Dual Band with single SO239 feed is only $ 43.
Please add $ 6. Shipping & Handling per order (for US Funds).

# 2367. Re: instructions on converting micor

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-06 00:00:00 UTC
From: Dale Wentz <dwentz@accessus.net>
Message-ID: <01bcbaad$a158ef40$a32404d0@dragon.mcs.accessus.net>
Source record: 91239

Our club did some conversions as a project here a while back. While most where UHF micors we did do a few VHF units. The VHF units take 2 xtals 1 for transmit and 1 for rec. Once the xtals are changed all that needs to be done is re-align the radio. Depending on the radio you might need to add some length/width to some of the cans in the radio. We did this by adding some brass tube to the slugs inside of the cavities. On the UHF units this was not needed. I have not done any of the VHF conversions, but have compleated about 8 of the UHF ones. A service manual from Motorola cost us about 15.00 for the radio.

Good luck with the project.

73's and type at ya later, de kb9jja/dale

I believe you are confusing the issues of technology and the issues of
legality.

Technically, the equipment used by amateurs ( hams ) can communicate
with an SSB radio - whatever form of SSB radio you have in mind. I
presume that you are speaking of a CB radio of the SSB type, or some
SSB radio in some legitimate service, such as Marine Radio.
Technology-wise there's no problem, because a large percentage of hams
operate in the SSB mode. So, aside from all the usual problems of
radio communication, such as propagation conditions, static,
interference, etc., it is possible.

Legally, however, operators in the amateur service cannot communicate
with other services (except in very specific circumstances outline in
FCC regulations). In other words, hams may not communicate with CB
operators or Marine Radio operators, even though they may be capable,
because the FCC doesn't permit it.

I have seen advertisements for satellite links into the Internet.
These take the place of the usual connections via Modem and telephone
lines. It's rather an expensive way to go. Ship to Shore radio, which
is a means of linking to land-based radio stations that can connect
into the telephone system, would be more practical for a limited
number of conversations.

```
Here is the latest index of L.O.S.A. It includes almost 100 ideas of
what you can use your BASIC Stamp's for (many with code). You can
download the complete L.O.S.A from the following places...

WWW:

http://www.hth.com/losa.htm

FTP:

ftp://ftp.parallaxinc.com/pub/text/losa.txt

1.0 Whats is L.O.S.A all about ?
--------------------------------

I started to compile L.O.S.A because I know there are lots of great
ideas and many problems that are solved with the BASIC Stamp and the
main purpose of this list is to get an idea of what other people are
using their BASIC Stamps for and maybe get some inspiration or hints.

1.1 How can I contribute to this list ?
---------------------------------------

If you have done something (big or small) with the BASIC Stamp that
you are willing to tell others please use the form given below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better but
it's not necessary.

Visit the following Web site and fill in the contribution form...

http://www.hth.com/losa.htm

# 2372. Re: Dan's 80m Centenial SSB

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-06 00:00:00 UTC
From: "P. Singh" <nospam@screwed.net>
Message-ID: <341130A6.6C3E@screwed.net>
Source record: 91244

It seems like allied.avnet has a few motorola PLL chips in
stock:-

MC145106P( a ridiculous CB radio PLL with Fmax = 4 MHZ !?!,
N counter=9bits),
MC145151P( fairly good PLL),
MC145162P( This seems like a great dual PLL with
60 MHZ/14 bit counters but available qty=0 currently!?!)
MC145191(1.1 GHZ PLL! WOW!)

The few MC145106 and MC145151 chips that I have were bought from
Jameco a few years ago( I think in 1995) .

It seems like that digikey has One 2GHZ National Dual PLL in stock
for $16 or so, but who would really want that!

Yes, I am trying to order a few more from guess who
( Arrow/Schweber !).

Those guys have the ridiculous policy of talking to only
companies!
It is really ridiculous as these guys do take credit-card
orders.
I dont know why they make it so hard to get sample quatities
of chips. They should actually send out samples free like
National Semiconductor does!

Arrow/Schweber has almost every chip that I want like:-
Ne602, MC3359, MC13055, MC145162, MC145170, MC145173, MC145200 etc
plus really good and easily programmable cheap and powerful
microcontrollers like ATMEL 89C2051/24.
Why bother with PIC if you can get a 24 MHZ 16 IO line + UART
microcontroller with 2 K byte FLASH and 128 BYTE RAM for $4.90!

I guess that they will send me my chips eventually!

Some people have told me about trying with Newark. They might be
worth a shot as well!

Well, maybe one day I will float a company just for the purpose of
buying chips from these large monster's of distributors to sell
to people who want samples !!!

73

PS: My reply address is (singhpk@exit109.com).
It is the spammers who are really the screwed !

Hi Folks,
Re parts and such. For Atmel, try Marshall's webb site, best one I've seen in a long time (they have the data sheets ready for download along with pricing and availability. Order via the net is easy and delivery is quick. Prices are usually 100 piece break (Signetics stuff) even on single items as near as I can tell. Not sure on the Atmel as their micros are so cheap to begin with. Did notice the ATMEL 8751 equiv but with flash rom is only $13 in singles..Jameco wants more than that for a NMOS 8751 of unknown manufacture.. Used them recently to buy Signetics/Philips I2R stuff.. good prices there as well

73 es good hunting

I tried the Marshalls website and tried to order online
Atmel AT89c2051/24/PI. These are the problems I had:-

1. Minimum order quantity is 18.
2. When I say that I want 18 chips it says that it is going
to backorder it, though the stock search shows
that these chips are available.
3. The online registration fails with error code "customer 0001"
whatever that means. Wants me to email their webmaster . I
might as well do that.
4. I think that behind the pretty flash screens and all, they
really dont have anything that works on their website!

Yes, If you look at the terms and conditions, they have one clause
which looks like a NDA to me. They say that you should not disclose
parts informations like datasheets to third party.

Maybe they will ask anybody who wants to buy their parts and use them
to sign an 100 page NDA! (Kill all the lawyers !)

Please pass this to the reflectors you subscribe:

I have a builder friend that has contributed a lot to our
repeater
projects. He's a "real ham" in that as an Extra, he likes to
build his
own CW Amplifiers. He has noted that he needs a pair of 450TH's
for his
CW amplifier project. We came up with ONE new one.

If anyone has more (including a spare or two), I would be
willing to pay

# 2378. HELP! HELP! My FT-51R

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-06 00:00:00 UTC
From: trex2000@txdirect.net
Message-ID: <3412d1e6.2065002@news.txdirect.net>
Source record: 91250

I recently attempted the "Mother of Mods" on my FT-51R. The mod appeared to work, but my ADMS-1 software would not. The software took a template fine, but gave me the error message (on HT screen) when I attempted to reload. Not being very satisfied with the reception with the hardware mod, I "undid" the mod. I then tried again to reload my freqs to the HT. Again I got an error message. I then manually entered my freqs, took a template via software, and found that the software had uploaded my freqs O.K., but did not include the tones I had entered. Transmission on the HT enabled me to discover that for some reason I had changed the radio into "Euro-Mode". Then, after doing the CPU reset (vfo+mr+2), I really found out I was in the "Euro-Mode". How do I get my HT out of "Euro" and into "USA"? Could my using the ADMS-1 (No version given, but copywrite ©95, SN 07950321) have caused these problems? Could my use of WIN95 have changed my software output or compatibility? (I did use both newer and older versions of CTL3DV2.DLL). My jumpers are set at original, not MARS/CAP, that is, JP 1,4, and 7 are closed. Can someone please help? Thanks in advance, Scott (KB5YOK)

Richard Burden wrote:

> Does anyone know what a LM3075 or LM3053 is?

LM3053 - Differential RF/IF Amplifier
Pin 1 - Input high
Pin 2 - Current source base
Pin 3 - Substrate and case
Pin 4 - Current source emitter
Pin 5 - Input low
Pin 6 - Output high
Pin 7 - AGC input
Pin 8 - Output low

LM3075 - FM Detector/Limiter and Audio Preamplifier
Don't have a pinout but it doesn't have a signal strength output.

# 2386. Need "Scope 4 PC" Schematics

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-06 00:00:00 UTC
From: Nuno Sucena Almeida <slug@pc1.local.aeminium.pt>
Message-ID: <5urcjb$t19@pc2.local.aeminium.pt>
Source record: 91258
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design

Hello,

some days ago i posted about wanting to make a TV CRT + some spare parts to make a scope, just for <1MHz use. But the majority of the guys who answered told me to buy/make a A/D to be attached to a PC to work as a scope.
Some time ago i found a schematic and program called scope at the Xforms WEB site ( i work with linux/X ). I haven't tested it yet but what i'm planning to do is a some better program with spectral analyzes, voltage indication, etc but the schematic doesn't include some kind of memory, which would be required to increase the BW ( miker suggestion ) and I think It would work better on a Unix Multitasking system like linux with one attached.
Now, what I want , beg, please please please :) is a good schematic or guidelines, web pages, docs , anything that would be usefull to me to make it work. ( miker suggested to use Cache memory but are there any standards for that kind of memory? I have some here, but some "normal" static RAM wouldn't do the job? And which A/D would you advise? )
I'll start the project late setember due to some Exams.
Thank you!

My, my, overly sensitive today aren't we?

I think Laura is correct. For any *reasonable* modern HF receiver,
the instances where atmospheric noise doesn't dominate are so
exceedingly rare that they can be ignored. As I noted in another post
listing the sensitivity of a selection of (inexpensive) SW receivers recently
reviewed in QST, modern SW receivers have a very low MDS, nearly
on a par with better VHF+ equipment. I don't think even you would
suggest that HF atmospheric noise levels ever fall below those experienced
at VHF+.

The acid test is very simple to perform, of course. If connecting the
antenna results in no discernable change in noise level, the receiver
is internal noise limited and can benefit from a low noise preamp. If
there is a change, a preamp won't help. Some (perhaps many) older
vacuum tube receivers fail this test, but in general, today's SW receivers
(even inexpensive ones) pass the test, even on 10m in quiet conditions.

If you know the max rating, why ask this question. Obviously the
voltage exceeds specs. If all you have is 3500 volts, use a
resistor to drop the voltage down. The plates on 572s don't draw
so much that you can't find a reasonable value resistor to drop
the voltage down to about 2600 volts.

Such is life in the electronics business. They're used to dealing
with large quantities, and a small guy is just a problem to them.
Unfortunately, for many interesting/useful chips out there, you have
to deal with these people somehow.

>I dont know why they make it so hard to get sample quatities
>of chips. They should actually send out samples free like
>National Semiconductor does!

>
>Arrow/Schweber has almost every chip that I want like:-

>Why bother with PIC if you can get a 24 MHZ 16 IO line + UART
>microcontroller with 2 K byte FLASH and 128 BYTE RAM for $4.90!

Yes, but how much does the development kit cost? I was at a trade
show some time back (Embedded Systems Conference East) and I saw (and
got databooks for) lots of interesting microcontrollers. Provided, of
course, I forked out $500 for the mandatory development kit. Not
good. I understand ATMEL is trying to beat on Microchip, so perhaps
their development requirements are now competitive. But you still
have to worry about *getting* the chip from a distributor who will
speak to you.

>Some people have told me about trying with Newark. They might be
>worth a shot as well!

I don't like Newark. I had an unpleasant experience with them when
they sent the wrong parts. They weren't malicious, just very
bureaucratic, disorganized and really hard to deal with.
I am told Hamilton-Hallmark is good to deal with but I haven't tried
them yet.

>
>Well, maybe one day I will float a company just for the purpose of
>buying chips from these large monster's of distributors to sell

>to people who want samples !!!

You could pull a Don Lancaster. Come up with a good company name and a story (for the guy on the phone who asks what you make). Use that persona to get yourself into any trade shows in your area (most shows will give you an exhibits pass for free.) As long as you present yourself professionally (not hard for most people) you shouldn't have a problem. Use the same trick to get trade magazines you're interested in. Also works on manufacturer's web sites to get yourself CD's. If you do this long enough, you *will* be professional.

Dave

# 2398. ATV / Sat. audio subcarrier spec?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-07 00:00:00 UTC
From: Woody White <"eMail "@my.www.page.Mailto>
Message-ID: <5uub1o$lgb@mtinsc05.worldnet.att.net>
Source record: 91173

Looking for spec on satellite broadcast audio subcarrier....

I have a camcorder used for ATV. Usually I use the camera with a hbrew 420 Mhz NTSC AM Tx. The "tape basket" was damaged (got good deal!), so I (also) built in the basket area, a 900 Mhz FM ATV xmtter. For rx, I am using a hbrew down convertor feeding a (free) old LNA sat rx box (70Mhz IF) which provides video out... Obviously the sat rx box will demod audio too, but I don't know what it "expects" to see. Have checked around the net and found audio subcarrier frequencies of 5.4, 6.8, and 7.38 Mhz. What freq is appropriate? Modulation of subcarrier-AM/FM, deviation? The old sat rx box does have left & right "audio tune" controls...

Thanks, Woody

> well.

This only works well if you're lucky.

There are two basic ways to feed a J-pole.

One uses the lower part of the J as a parallel-wire transmission line.
This is basically an end-fed Zepp arrangement. I've never done it, but I
expect you have to be careful with dimensions to get this to work right.
Arrow Antennas makes a J-pole of this type.

Most of the Ham literature describes using the lower part of the J as
a stuned stub. It's shorted at the bottom, and you need to experiment
(as described by Howard above) to find out where to connect the feed line
to the stub.

However, you should use a balanced feed -- not unbalanced coax. In my
experience, using an unbalanced feed yields a hard-to-tune J-pole whose
behavior is strongly affected by nearby metal objects, height above ground,
and other factors. It's easy to make a balun (about 26 inches of coax
bent into a U-shape -- see the handbooks), and I recommend it highly.

It doesn't matter which side of the stub you connect the center conductor
or shield of your feed line to. Most of the books show the center
conductor connected to the short side of the J and the sheild to the long
side. This seems odd, but it doesn't matter.

Before doing too much experimenting with the connection points, you should make sure the J is the right size for the frequency you want. Connect the feed line to the recommended points on the stub (usually about 4.5 inches up from the bottom) and measure the SWR across the band. You may find that the minimum SWR is not at the center of the band (or wherever else you want it). Adjust the length of the long side of the J so that the SWR minimum is where you want it before you spend time adjusting the feed points. The location of the feed points on the stub affects the the value of your minimum SWR but not where it occurs in the band. Small changes can have a big effect, so take it slow.

Osciloscope prescaler! WOW !

ME TOO !!! (like aol idiots)

Well,

You might be able to build a mixer which could convert
30-60 MHZ range to 0-30 MHZ but it is just not worth it.

Get a better scope or get a life !

Thats rather childish of you.

This person has decided he does not wish to receive junk email, and to be perfectly honest, who does.

The antipspam trick is his way of getting round receiving it. Whats wromg with that? Are you so lazy that you can't remove it from the address?

I would say that if you think like this then he can do without your help. He'd be better off.

Sic, what ever happened to amateur spirit?

Body handling: HTML body converted to readable text

I have in my garage a complete GRA-4 military antenna pole set made by Guytronics. I am a novice at antennas, so I am offering this great trade for someone in the SF Bay area.

I really need someone to manufacture for me a directional antenna with as much gain as possible for the 118-136 commercial aircraft band. (I don't know the term but I think it is a yagi) I need to stress the maximum amount of gain is needed. I saw one for sale at a hamfest but as usual it was cut for 2 meters.

I know there is someone out there in the SF Bay area that has the materials needed to make this for me. In return I will trade you the GRA-4 antenna.

I don't know how high it will go but I believe it is really up there. The fella I got it from says you need to put the guy wire rings at the 3rd, 5th, and 8th poles.

It is a complete set including the small sledge to pound it in. This is a heck of a deal for anybody in the SF Bay area that can call me back the fastest. I would really like to pick it tomorrow if possible. I will deliver the antenna set if you're close or meet you half way if not. It would be too expensive too ship anywhere

This is a great deal for someone that needs a set for weekend dxing to get your antenna really up high.

Call me and let me know how much gain I can expect from your design or one you already have..

Thanks,
Tom Montgomery

The Cheap Alarms are not designed with rf bypassing and go off in the presence of rf.
I've set off alarms of people on the freeway next to me, it really brings a confused look on the drivers face.

Sure. takes more bias, and they probably won't last as long. The
insulation is there.

Hi Dean, that's what my elmer told me in the early 1950's. Also there's
a word-origin column called "Word For Word" that appears in some
newspapers.
A column from years ago sez, "A 'ham' radio operator is certainly a play
on
the word 'amateur'. The term was coined in the 1920s."

I, like you, am not sure what was meant by "analog prescalar", but if we assume it is a method to read in data (analog voltages) at a high rate and read it out at a low rate, and thereby display waveforms faster than our 'scopes can handle, there is a way. Well, more or less there is a way. It is intrinsic that information will be thrown away.
The method has been used in some digital scopes. The voltage is recorded in a fast CCD, loading the cells with a fast clock rate, and then reading the data out at a slower clock rate. In the digital oscilloscopes the ADC then digitizes the slowly emerging voltage stream but there is no reason why it could not just as well be displayed on an analog scope.
The trouble with mixer schemes is that you are pretty well assured of loosing a lot of harmonic structure which going to a fast oscilloscope would reveal. In short, they seem to be useful only for a rather limited range of applications.
Whether any of the above has anything to do with what the questioner wanted remains a guess.

Bob

## 2426. Help wanted to identify/source components

Hi All

Need a little help identifying some parts used in a past radcom project
by GM4DJS, for a magneto-resistive magnetometer.

Sensor, possibly hall effect(?) part no. KMZ10A (4 pin square device)

Opamp, simply identified by no. 759 (4 pin device)

Be obliged if anyone can help identify/source these items.

Cheers

> Where did the term HAM come from? When did it come to popular use?

The *real* explanation appears to be lost in the mists of time. There are a number of theories. Some more plausible than others. The one you'll likely hear the most is about "little station HAM". It goes like this. In the early days of radio, the government didn't assign call letters to amateurs. They just made up their own. Supposedly, three students at Harvard named Hyman, Almay, and Murray set up a station. They decided to use their initials as the call. Thus we have the little station HAM. When the Navy tried to grab control of all radio frequencies, these guys are supposed to have testified before Congress, and the story of little station HAM supposedly didn't leave a dry eye in the house. The press is supposed to have picked up this story of little station HAM, and amateurs have been known as hams ever since.

Unfortunately for this story, none of it checks out. A past president of the ARRL did extensive research in an attempt to confirm this story. There is nothing in the Congressional record about little station HAM. There is nothing in contemporary press records. And there is no record of a Hyman, Almay, or Murray at Harvard at the time this supposedly happened. This story first surfaced in an amateur publication in 1948, and doesn't seem likely to die. But it appears to have no factual basis.

Another story you may hear is that ham is the result of a Cockney pronounciation of (h)amateur. But that is unlikely for two reasons. First, the term was in use in America before there was substantial amateur activity in Britian. And second, voice transmission wasn't used by amateurs of the era, so how did a pronounciation get propagated by Morse?

Another story you may hear is that it comes from a landline telegrapher's insult. Many operators of the day came from a landline background, and on the landlines a common insult was that someone was "ham fisted" in his sending. It is possible that commerical operators used this slang to refer to amateurs and it caught on. Certainly, the term LID came from landline telegrapher slang. (LID was a reference to use of a tobacco can lid on the sounder to aid a poor operator in copying Morse.) This one may be true. It wouldn't be the first time that a group adopted a term originally meant as an insult to serve as a slang term for themselves.

But the one I like best goes like this. This era was filled with pulp magazines catering to the experimenter. (Everyone at the end of

the Victorian age apparently viewed himself as a closet inventor or tinkerer.) One of these magazines was called Home Amateur Mechanic, and it featured many simple radio sets a person could build. It is likely that when asked what kind of radio an operator was using, he might send back RIG HR ES HAM, meaning that it was one of the circuits shown in Home Amateur Mechanic magazine. Since telegraphers tend to abbreviate everything, due to the low throughput of Morse, this is plausible, and Home Amateur Mechanic magazine certainly did exist in the correct era. So it was those HAM radios which started the use of ham in amateur radio.

Yet is right. When "WE THE PEOPLE" begin to think too much, and
then we talk about it via the web, suddenly, new rules will be made.

No right minded American is going to resort to bombs. We do have a
major developing problem. It is that our government is becoming out of
control and more dangerous to our health and freedoms, but we still have
time to simply change it. No force is needed. Marching in the streets
is not a bad idea, but only peacefull marches. Let Big Brother be
guilty of excessive force.

In case you've never heard of it, 'homebrew' (part of your newsgroup title) also refers to beer brewed in the home. Unfortunately, someone posted to your group assuming that is what the 'homebrew' in the group title meant. I am sure it refers to home-made amateur radios, but someone got confused.

Flame if you must -- I only replied since you cross-posted an off-topic comment to groups which the original poster had correctly identified as being interested in what what he was talking about (like rec.crafts.brewing). Perhaps you could let things like this slide some, or respond to the poster directly, instead of continuing the cross-posting which bugs us all when done haphazardly. I apologize if I have offended anyone, this wasn't meant as a flame.

I am trying to make a printed circuit board using the Toner Transfer system sold by Digi-Key. I've done this several times at my old job - really nice surface mount stuff too - but I had the luxury of having the nice little heater/roller made specifically for doing pc boards. But I've changed jobs and no longer have the heater. I tried doing it on an electric stove top - I place a sheet of .060 copper on the eye then the transfer paper then my board then another sheet of copper then a weight. But this just doesn't seem do be working. I can't seem to get it to work out after six attempts. I'm getting tired of wasting my transfer paper & would like any suggestions. Please email to:

slankford@scires.com

I found this layer of the responses rather interesting. I am the jerk who complained about the antispam trick in the request for help. In this case I was about to write for clarification of what the fellow needed as I am not sure what an analog prescalar is! Rather than guessing it seemed wiser to ask what was intended in the original request. The antispam was a putoff- am I the lazy one or the folks who want help but are too lazy to spent a few seconds a day purging their spam (Yes, I hate it too, but I don't slam the door in the face of those who are attempting to bring me something I want- forcing them to jump over a hurdle to reach me!)
Email did and still does seem like the better solution, rather than the public discussion of unclear concepts in the newsgroup. Why make email harder than it needs to be?

Incidently, if every user of the Internet simply ignores the spam no matter what its content, eventually the spammers would realize it is a useless advertising method. Perhaps they would then just dry up and blow away.

The radio club where I used to live regularly set off the alarm in a
nearby house when we were Txing on 2m.

Here in the UK, many car entry systems use a frequency in the 433 MHz
band (it's a shared allocation here). People often find they can't get
into their cars when they are in the vicinity of a 70 cms Tx. The
manufacturers have learnt their lesson, and are now using sensible
frequencies.

Yup... I often set off cheap car alarms while chatting in the shopping
mall's parking lot with my 2M.

Seems many alarms do not like 5W fed into a 5/8... never mind what
happens at 45W at rest stops on the highway... :o)

Gary wrote in response to Bill:

<The acid test is very simple to perform, of course. If connecting the antenna results in no discernable change in noise level, the receiver is internal noise limited and can benefit from a low noise preamp. If there is a change, a preamp won't help. >

Does it make no difference how the input is terminated? A similar test at the input to the audio stages of Rick Campbell's R1 and R2 led to a design inferior to what Rick and Wes Hayward later found to be possible. There the problem was that changing the termination of the input network from 50 ohms to an open circuit dramatically changed the impedance seen by the low-noise pre-amp.

The correct test is to replace the antenna lead-in with a 50 ohm resistor at room temperature. If the receiver was designed for a 50 ohm generator impedance, then the ratio of antenna noise to 50 ohm thermal noise is accurately determined and the receiver is undisturbed. If the antenna line impedance is not 50 ohms then there may be a discrepancy that needs to be resolved.

My receiver has this ability, using the 50 ohm transmitter dummy load. I can easily determmine atmospheric noise level. Sometimes the noise margin is not as great as one would suspect. To be completely free of receiver noise the antenna noise should be about 6 to 10 dB greater than receiver noise with the 50 ohm resistor.

A quite common problem occurs in narrow CW modes, where the receiver noise figure degrades because of the wideband IF/AF noise that follows the narrow CW filter. I have seen this many times.

That's usually a secondary factor. This was the case with the R1 (and
later the R2). Most radios have an RF preamp with a bandpass filter
ahead of it. That usually limits the effects of poor terminations.

If one suspects poor termination is affecting the internal noise
measurement, replace the antenna with a dummy load.

From: nospam <nospam@screwed.net>
Message-ID: <3413E124.3ABB@screwed.net>
Source record: 91210

hello everyone,

I apologize for posting that bad response to that scope
question.

I guess that I just dont have a lot of patience left.

But, the gist of the response was that there is no
osciloscope analog prescaler in this world. What
do you mean by a osciloscope analog prescaler anyway?

The closest that I know to an scope analog prescaler is
a sampling osciloscopes as made by Hp tens of years ago.
They used some sort of chopper circuit in a sampling probe to
sample a 1 GHZ repititive signal say at 100 MHZ or
10 MHZ I think. Not a very good thing to build either way.

So, the next think you could do was to build an scope
mixer as they say in the ARRL handbook. That is the
suggestion I posted. But that shifts the spectrum and in no
way is going to pre-scale it.

God knows what that mixer will do to the waveforms.
Didnt they say that multiplication (or mixer) in frequency
domain will equal convolution in the(frequency) other domain.
So, to get the original waveform back he will have to
de-convolve the resulting waveform back. RIGHT.

(You DSP geniuses can say something here.)

But, the gist of this whole thing is that there is no real
solution to this guys problem of making a 10 MHZ scope work like
1000 MHZ scope. If he needs a 1 GHZ scope, he will have to buy one.
That is it.

Well, he will probably be able to find some manuals for that scope
anyway.

That is what I think!

My apologies again!

Yes spam is a big problem!

I have had much better luck with a product called PNP Blue. The base
is plastic, not paper as in the Toner Transfer material. This
eliminates the problem of shrinkage during the fusing process.
Check-out http://www.flex.net/~geotek/nars/pcboards.htm for details.

Oh this one's easy!

Use an iron! I dunno what you call them in the US (the thing used for
uncreasing clothes!)

Print the layout onto laser transparency film (no expense spared here!)
Makre sure the print is the right way so the ink is down facing and the
right way round!

Place some kitchen tissue paper over it with the pcb layered like
this:(we call it kitchen roll over here!)

```
| | iron
-----------------------------

============================== Kitchen roll

------------------------------ film

============================== pcb copper
```

Put the iron on hot and when ready place it on the tissue paper , apply
pressure (but not too much) for a minute or so, gently pressing on it.

Remove the iron and leave to cool (don't try and peel it off straight
away)

GENTLY peel the film off from one corner and it will leave a hard shiny ink layer on the copper! Easy!

Make sure the copper is clean and dry and get a nice dense print on your film too.

I have done a few pcb's like this inc a 3.4 GHz tvtr board and they all turned out great!

Cheap too!

Good luck!

This is absolutely amazing! It is hard to believe that David Abrams has
actually posted something of relevance to the radio newsgroups. If he were
any old newby, I would say that he would deserve a polite and helpful reply.
However, he is one of the worst and most flagrant posters of irrelevant
political diatribes in these newsgroups. The explanation by Steve S is
correct. If he had had any kind of reasonable education, he would be able
to understand what Steve S wrote. Now he displays his ignorance and
incompetence in radio related areas. It goes well with his inability to
show some maturity and self-restraint by keeping his political postings
to appropriate newsgroups. Or maybe he has tried that and could not keep
up with the arguments, so he wandered off thinking he could impress us
with his knowledge as he shows off his stupidity.

I'm sure that this was discussed in the RSGB's Radio Communication
magazine some years ago but I'm not about to start digging through the
pile in the attic!! From what I remember "Ham" is derived from the
acting profession, a "ham actor" basically being a poor one. My Concise
Oxford dictionary certainly agrees with this, " an inexperienced or
ineffective actor, one who rants and raves"! IIRC from the Radcom
discussion the acting term came from the fact that the early greasepaint
used as makeup was based on pig grease - hence "ham"!

I expect we'll never learn the real origin but I learned something from
this discussion, although I haven't heard the term "lid" for years I
always wondered what it came from, mni tks to tt poster!

The term "Ham" is intensley disliked by many UK Amateur operators -
Where on earth did you get the idea that the term was in use before
there was *substantial* amateur activity in Britain. The UK has a
proud history of radio experimentation preceding the introduction of
the word Ham.

The Concise Oxford Dictionary has it as slang for an amateur, as in ham
actor. It also mentions the terms ham-handed and ham-fisted, for someone
who is clumsy. This is probably why "ham" isn't used much by radio
amateurs in the UK. You *never* see the word in RadCom, unlike QST.

Sure it has,

Beginning with this guy who had come over from Italy. As far as
I remember he only went to the US after Britain had become too small
for his DX-tests. This was around 1901.

Unfortunately the cost of going to college has caught up to me
and I must get rid of some of my toys :( I have the following
setup forsale and I will only sell it as a complete package:

1 - 23cm FM Transmitter for Video and Audio
Tunes the whole band, SMA connector on output.

1 - 1W Tron Tech amplifier with oversized heatsink
Model P26GA-1

1 - 18W Down East Microwave amplifier with repeater grade heatsink.
Model 2318PAHS

1 - Homebrew 23cm Preamp, has gains in the low 20dB range.

1 - Hewlett Packard Coaxial Relay, good from DC to 4GHz.
HP 33314A, SMA connections with hardline to connect from
the 18W brick and a SMA to female N hardline run for the
antenna connection.

Hardline connects the transmitter, and amplifiers together.
>From the transmitter to the 1W brick, SMA connectors are used,
>From the 1W brick is a SMA connector and into the 18W brick is a
N connector as is the output of the 18W brick.

1 - Microdyne receiver, Model CSD-BQR-1
Tunes whole band. Manual included.

1 - Microdyne receiver, Model 1-100-BKR
Tunes whole band. Manual included.

All schematics and notes are included on the setup. All one needs is
a camera, antenna, and 13.8V power supply for the transmitter and amplifiers
to get going.

All this for the low price of $500 plus shipping, firm.
Please email me if you are interested since I am rarely home while going
to school. My address is cmlong@mtu.edu

Thanks,
Mike

When radio was being developed at the turn of the century, and the fcc
was created, commercial interests wanted all the frequencies. However
certain portions of the high frequency band were allocated to amateur
radio enthusiasts for experimentation, the feeling being that they could
never develop radios that would transmit more than a few miles.
Thus, HAM stands for High frequency AMateur.
Anyone got one better?

Well, I *may* have gotten it right, Mark. It is certainly a plausible
explanation. We don't know definitively, however. A lot of folks
have tried to track down and document the origin of the term, but
no one has been able to discover who used it first or why.

# 2476. Product Annoucement

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-10 00:00:00 UTC
From: info@sparksintl.com
Message-ID: <5v6o66$cto@bilbo.w-link.net>
Source record: 91063

For complete information, visit: http//www.sparksintl.com

If you had told me a year ago that I would
be marketing a product that claims it will
remove two inches of fat in 24 hours,
I would have laughed.

"It sounds like snake oil," I would have told
you. "I wouldn't be involved with anything
that ridiculous."

...So much for predicting the future.

HERE'S WHAT CHANGED MY MIND:

Last December, I pushed my doubts aside
and tested the gel on my own "fat-prone
areas" -- stomach, hips, and thighs.
What happened just 24 hours later turned
me, an avowed skeptic, into a wide-eyed
believer. I lost 2-1/2" from my waist,
2-1/2" from my hips, and 3-1/2" from each
thigh -- overnight. I couldn't argue with
my tape measure or the way my painfully
tight jeans were suddenly comfortable.
My husband lost two inches from his worst
area -- his stomach. My mother-in-law
lost 1-1/2" from her stomach, and her problem
was a little bit of flabby skin, not serious
excess fat.

Now my company is marketing this miraculous
product around the world. And we're looking
for serious, motivated people who would enjoy
making terrific money while they sell a reliable
product that delivers results.

HOW OUR PRODUCT COMPARES TO OTHER PRODUCTS ON
THE MARKET...

1. It removes excess fat immediately, within
24 hours. You don't have to wait weeks or months
for it to work as you do with some "body contouring"
products on the market.

2. It liquefies fat naturally with common, European
herbs that have been used safely for centuries; the

fat is then eliminated by the body naturally thru
urination.

3. It's 100% safe, 100% herbal,
100% hypo-allergenic.

4. Quick and easy to use, it takes less than
an hour to apply.

5. No side effects, no after-effects, no strange
sensations - just great results!

6. It can be used repeatedly to lose multiple
inches and maintain the fat loss over months,
even years.

7. Affordable even for people on a budget.

Dear Simon and Sympathizerers,
Interesting responses! I suppose if you don't want junk mail
brought to you by the British Post Office or the United States Postal
Service (and I am sorry, but I do not know the official name of the
Canadian post office and don't plan to guess) you would just weld your
mail boxes shut and let anyone with anything to say to you send a FAX or
phone you up, or... Is it not the more like adult behaviour to accept
what comes, and erase it after ascertaining it it is junk mail? Perhaps
your systems for receiving are more difficult to use than mine but I
just touch a little "X" with my mouse cursor, punch the button and
forget the junk. Conversely, somebody trying to contact one of these

"nospam" address must, in order to offer help, figure which version is present here and then undo it. I would say if the user of a "nospam" method is too lazy to purge his spam, he is rather hard pressed to object if someone attempting to send a message objects to purging his particular "nospam" trick in order to enjoy the privilege of offering help. Getting rid of the spam is far easier (at least my software offers no "remove the "nospam" gimmick" button. Am I behind times?)
I checked and there is no evidence any of you defenders of "nospam" have sent any help in response to the original request. Thus, Mr. Carlisle-"Boy, now that he knows this guy wont (sic) be sending him an e-mail, he will probably have a breakdown." I assumed he would need no email from me after reading that because YOU helped him. Didn't happen!
Then we have the message quoted at the top. Please note this comes from the editor of an important microwave publication. We can take it for granted (can't we?) that he must have the technical competetence to answer the question intelligently. Furthermore, as a man living from the printed word it would be just a small effort to dash off a message to tell the fellow how to make his analog prescalar. Words are an editor's specialty. Well, it never happened as far as I can tell. At least the posting never made it to my monitor. I have been watching for it. Are YOU so lazy you can't help, although it is a small matter for you to do to do so? "....then he can do without your help....." Sure he could do without it, if you or the others offered their help. But again, it didn't happen. Sir, you are a strange one to point a finger and ask "Are you so lazy....." If I may speak in my own defense, I had expected to seek a clarification of what the analog prescalar was intended to do (until running once again into an "antispam") followed by trying to describe how such a thing could be made, what the technical limitations might be, and if it were hopelessly impractical, throw in a few words about why that is the case. None of you who were displeased about my objection to the "nospam" device seems willing to be bothered with such childishness as helping and educating. Talk about LAZY.
Finally, it is my opinion that these "nospam" devices have no future. I feel confident the spammers (or the ones supplying the software) are now busy writing software to filter the "antispams" out and this method of defense is bound to lead to endless escalation but no security. Only if the spammers one day notice they are wasting their time will they go away. In short, the problem will be gone if we ALL hit the little "erase item" button, no matter what is contained in the latest can of spam.

Bob

PS#1 I look forward to reading about the clever and original designs for analog prescalars!

PS#2 I think I will try to preserve the childish innocence which drives me to rise to a technical challenge and to help those who are having trouble with their own technical challenges. I hope I don't have to depend the the brand of adult who can't lift a finger to offer help (or is it that the entry into this sort of adulthood atrophies the brain so

coping with a technical question is no longer possible) but seems more concerned with the right to prevent any and all intrusions even if it means locking out the answer being sought. I also hope some of the innocence will be there when I run into a technical problem and beg for help. I promise not to weld my mailbox shut or to throw up unnecessary barriers to those who are ready willing and able to get me out of my bind. "God save the children....."

Having just went through many batches of sample 572B's, I would NEVER
run more than 2700 volts on them.

With 2700 volts dc the peak anode voltage positive swing will reach
nearly 5200 volts IF the PA is properly loaded and much more than that
if you have a load fault or mistune the PA.

The bulk of tubes fail hi-pot tests for voltage breakdown at 7000
peak volts, and about 30% fail at much less than 5500 peak volts.

In the old days of good QC you might have gotten away with it, but
with newer tubes (including Cetrons and ESPECIALLY the Chinese tubes)
you'll be in for a bad experience.

If you are involved in the design of transmission lines, directional couplers, distributed filters, or RF & microwave electronics in general, take a few minutes to acquaint yourself with the all-new TransCad Version 4, the most comprehensive single & coupled structure synthesis offering available:

http://www.webblabs.com/transcad.htm

TransCad is without peer. And with TransCad there is no single-user limitation. The one-time $975 license fee allows department-wide TransCad usage, with no annual support fees and free upgrades for two years! TransCad is a necessity for every department involved in the design of high frequency electronics. For more information, see our web site or e-mail your questions. TransCad is in stock for daily shipping to any destination worldwide.

Sincerely,
Kathy Goerg

I use a regular electric iron. (no steam) turn it up as high as it will
go. Let the iron heat up for severial minutes. Put the pc board on a
smooth peice of board something that won't bend. place a peice of cotton
cloth over the transfer sheet and pc board. Iron. you will have to try
trial and error to get the right time frame.
The ol bought a new iron and I repaired her old one and keep it for this
purpose. works every time. I print out the trace on my old HP LJ II. If
I do get skips I black em out with a regular each resist pin.
Hope this helps.

>available. Need one for old Hallicrafter sx 101 and ht 37 rigs I
>want to refurbish.

In keeping with the TRUE spirit of amateur radio, and going along with the neat old-timey Hallicrafters gear...

BUILD YOUR OWN!!!

For years, I've used Potter & Brumfield (and similar) octal-base DPDT relays with 115 vac coils for T/R switching between vintage amateur transmitters and receivers. These common relays will easily handle 100 Watts of RF (or at least I've never had one fail or give me any trouble). They're easy to find, cheap to buy at flea markets and swap meets, and fit a standard octal tube socket (also easy to find and cheap to buy). Use one pair of contacts for antenna switching, and use the other pair for receiver muting. Be sure to get one that runs on 115 vac, as most old transmitters supply this voltage to the rear panel connector when they are thrown into transmit mode.

This is a VERY CHEAP alternative to costly coax switches (such as the venerable Dow-key models). How costly? I just sold a Dow-key relay in as-is, untested condition (it came in a box of junk from a silent key's estate) for $35.00! I've seen them in tested, guaranteed-good condition selling for $50.00! You can probably pick up an octal-base relay and socket for a dollar at a swap meet, or free from someone's junkbox. I am not aware of any coaxial relay kits.

73 and keep on home-brewin'...

John,

I don't know anything about what you're talking about, but I will respond with an answer anyway.

You remind me of a guy here in the office who will often approach me with what sounds like an innocent question. I'll take a shot at answering it, only to have him shake his head and say, "Nope! That won't work!" In other words, he essentially already knew the answer and was just testing to see what my answer would be.

Instead of knocking the "wrong" answers you get on the group here, why not synthesize all answers received into a sort of consensus that is closer to the truth? After all, we are all amateurs, or at least that's our lowest common denominator, all armed with computers and access to a news group. That combination will always lead to a spectrum of answers whose accuracy will more or less follow a normal distribution.

I, like you, have experienced exactly the same phenomenon, most recently when I asked for help quieting down a noisy switching mode power supply. The 10% of answers that were "right on" solved my problem, and I couldn't be happier with that! The very ability to ask is something I've never been able to do before, and I'm very grateful to be able to do so.

Good luck to you. If I ever respond to a question incorrectly, just pitch my message and go on to the next one. And then do us a favor by posting the resolution to the problem so we can all learn a little bit more about this stuff.

R,

Al

Benjamin,

The Micor is probably the second most popular repeater conversion there is. (After the GE Mastr II of course). You can build a repeater out of a single unit.

Somewhere in my bookmarks I have a website that details the conversion, but it is on a different machine. If I find it, I'll e-mail it to you directly.

Hope it helps,

Ron, N7TAW

I think your statistics are a little pessimistic. As I read the threads I get the impression that most answers, as argumentative as they might be, are at least an order of magnitude better than the questions. Actually, I think most responders are very sincere and trying to be helpful.

For example, questions for help are often posted with almost no relevant information that one would need in order to give even a superficial answer.

People ask questions about ham radio equipment, and their questions sound like they're probably not hams - so what are they planning to do with the equipment?

I'm still laughing about the XYL who posted a request for help with TVI, etc., while her ham husband was away on a vacation. That was wild.

Whatever its faults, it's the best game in town.

# 2501. Re: car alarm activation

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-10 00:00:00 UTC
From: duane.vincent@greymatter.com
Message-ID: <873857311@greymatter.com>
Source record: 91149

I remember well the time I was working swing shift, and chatting with a friend on the 146.96 repeater while driving home. Sure enough, a car alarm went off. Curious, I went around the block and repeated the key down - the alarm went off again! Soon, the owner came out and turned the alarm off. It became a nightly habit on my way home to chat with my friend on the repeater...
A few weeks later, I went to graveyard shift, and continued my chatting.

Eventually, the car owner wised up and moved the car to a side street.

If you bias the tubes properly, no problem....572b's are fairly rugged....you may shorten the tube life a bit, but 572b's are relatively cheap anyway.

A place that sells the test sets can order these for you.
BTW, for thin wire, the little round group of tiny spikes works better
than the one larger spike.
The tiny spike type is called "bed of nails".
If you want to order them directly...the main manufacturer is J.S. Popper.
Note:the rubber boot is often not included, unless you pay extra for them.

The term "ham" was in use long before the creation of the FCC in 1934,
or the displacement of amateurs to the short waves.

Er, ah, the pseudo-CW as written makes no gramatical sense.
Lets try RIG HR IS HAM or RIG HR DE HAM. The latter
makes the most sense, IE it says the rig is *from* Home Amateur
Mechanic magazine, but the former may have been the one used.
Apparently, no one alive today knows.

:
:Some questions: The three pole filter as expected has significantly
:more
:insertion loss than the simple one rock filter that I'd been using
:previously.

What BW are you using?? A three pole filter made of even crappy crystals
should be usable down to 500hz or 1khz without too much IL.

However, if the three crystals are not well matched in center freq, that
would cause the problem you are talking about. If you have alot of
crystals, you could socket them, and mix and match until you get decent IL.

Rob

# 2518. 900 MHz phone- extend range?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-11 00:00:00 UTC
From: tosca@warwick.net
Message-ID: <341e97a3.9072121@news.warwick.net>
Source record: 91016
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design

Hi all-

I'm now a (not so proud) owner of an AT&T (Lucent Tech) 9100 900MHz cordless phone. The clarity is good, and I like the design, but the range is less that what I require.

I need to go about 800 feet or so to an out-building on my property, and it just doesn't go quite that far.

I'm looking for assistance to design a proper outdoor antenna for it, that I would be able to mount anywhere between 5 feet (right outside a window) or 30 feet (onto the chimney on the roof) so I can extend its range? I used to use one years ago on my 49Mhz cordless, and it worked great until they got too popular in the area that I lived- then all sorts of weird stuff started happening!

I'm not worried about interfering with any other equipment, as these buildings are secluded, and away from any other property owners.

I would rather go with the antenna idea, but if some type of linear amp or circuit mod is available to boost range, I'll consider that too. (I have enough electronic experience)

Considerations: plastic exterior whip antenna on base unit, about 4.5" in length- cant just hook up a clip lead to it with a length of wire! How does one retrofit the proper impedance coax to something like that? (Remove and connect to the board, I would guess- There goes my warranty!!) Any ideas?

- Diagrams are proprietary and not available to ANYONE except Lucent.

Any takers?

Pardon me, but what is the best and simplest way to verify if an IF
filter has not drifted off after many years ?
My good old TR-7 has a Network Sciences 300Hz filter, and when I
switch to it the S meter goes down 10 dB.
I realigned the rig and found that peaking of Ls and Cs was difficult
to see on the S-meter.
Is it a symptom of ageing filter ?
More, background noise,even after audio filtering, is very annoying.

I was once told that the word "ham" was slang for amateur in the early days
of radio.

Source record: 91097

I post two kinds of articles on Usenet. One kind asks for help, and the other kind posts information - either in response to a question, or just to report experiences that I think are useful to other people.

When I post a question, I will always include my real return address in the article so that people can answer my question by email. I don't expect them to figure out how to fix up a mangled "nospam" address. Conversely, when I answer someone else's question by email, and it bounces because their question has a bad address, I usually just trash the reply rather than figuring out how to fix the address - so the person asking the question just lost a potentially useful reply.

Thus, I think that requests for help should always have a real address in them.

On the other hand, most of what I post is information, not questions. I don't expect a reply. So far, I use my real address in these too, so people can send me unsolicited comments anyway. But I may change to using a mangled address in these. I get far more spam than I get real mail, particularly if you count bytes and transmission time. All of the 24 kb long chain letters take a while to receive before they are junked, even if they are junked automatically. I could really do without the time spent receiving and junking these things.

Thus, I don't think it's unreasonable to use a bogus address in postings that I expect no reply to. I have not begun doing this yet, but I understand those who do.

What I don't understand is people who ask others to help them, but don't provide a valid mail address. If it's significantly harder to help you than other people, many people just won't bother.

Dave

It is more universal than that. "Ham actor" referred to an amateur
actor and carried over into radio.

I agree 100%. I will try to help those that ask for it but I WILL NOT try to decode their anti-spam measures. If my reply bounces I trash it. As you said if I post for help I give my real address to make it easier for people to send me e-mail. Anyone that lists something for sale and then includes an anti-spam address will not get a reply from me.

Spam is a problem but I can overlook it if I get the help I need or sell something.

>mail boxes shut and let anyone with anything to say to you send a FAX or
>phone you up, or... Is it not the more like adult behaviour to accept
>what comes, and erase it after ascertaining it it is junk mail?

Why should I accept unsolicited mail? World advertising has gone mad. I get offers from the TV, through the door, on the phone, my fax, my email. If I wanted to buy these products I would enquire about them. Its bad enough having to watch them on TV without having it rammed down my throat elsewhere. I can't even walk down my street in the town without somebody stopping me and trying to sell me something.

That is invasive advertising, and IMHO damm annoying. As for email advertising it end up costing ME money because I have to sit and download it and sift through it in my normal mail. Is that right? Should I have to pay for someone else's advertising? I don't think so. It might be acceptable in other countries but here in the UK there is a great deal of anger over junk mailing.

Whats it doing to the environment? Do we really need to generate all this junk paper?

> Perhaps
>your systems for receiving are more difficult to use than mine but I

As I said, you're lucky. Most of the rest of us have to devise and test ways of getting round this and this seems a good idea for now. I am sure

someone will get round that but at least it works so far!

So if a user has no other way to ditch junk mail then he's lazy? Sic.

> I checked and there is no evidence any of you defenders of "nospam"

Maybe no-one knows the answer? Better not to send anything rather than a tirade of abuse.

> Then we have the message quoted at the top. Please note this comes
>from the editor of an important microwave publication. We can take it
>for granted (can't we?) that he must have the technical competetence to
>answer the question intelligently.

Important - thankyou, but I don't consider my newsletter to be 'that' important. As it happens I have no idea about his problem, I deal with microwave RF and operating. I am not in a place to answer his question so therefore instead of trying to look smart and give him an incorrect answer or advise, I did the right thing - I said nothing. Unlike some others who seemed more interesting in shooting him down, rather than offering constructive advice.

> Furthermore, as a man living from the
>printed word it would be just a small effort to dash off a message to
>tell the fellow how to make his analog prescalar. Words are an editor's
>specialty.

You really ought to check on your facts before you start making sweeping statements of drivel* like this. Do you know alot about my newsletter? Do you know how much it costs to subscribe? Well I would have actually checked before accusing someone of the above. My newsletter for your interest is actually free, I do not charge for it. So how can I make a living from it? I'd be a very poor man if I did, indeed I would owe money as I have to pay provider fees and telecom charges to distribute it and keep my webpages running. I do this because I offer a service to microwave operators who subscribe to it. I do it because I enjoy it, not to make money out of it.

Its called AMATEUR SPRIRIT. It something that quite a number of people seem to have forgotten and the internet seems to bring the worst out in some people.

> Well, it never happened as far as I can tell. At least the

>hit the little "erase item" button, no matter what is contained in the
>latest can of spam.

That maybe so, but they do work at the moment. You won't persuade advertisers to stop just by ignoring them, and again, why should I pay to download it in the first place. I didn't ask for it in the first placce.

>PS#2 I think I will try to preserve the childish innocence which drives
>me to rise to a technical challenge and to help those who are having

Hi Dimitris, One of the W2DU baluns should do the job. Get 7 or 8 ferrite beads (the ones that are about one inch long) that will fit over your coax. Make sure they are rated for 3.5 to 30 MHz. They should be fairly cheap. Slip them over the coax at the point where the coax meets the balanced line, and secure them with nylon ties. The beads should suppress any currents on the outside of the coax feed line without interfering with antenna operation. 73 and good luck. Bill N3WK

Hi Ray, here's a quote from the "Word For Word" newspaper column:
"An earlier 'Word For Word' suggested that the term 'Ham Actor'
probably referred to the ham fat once used to remove make-up.
On the other hand, a 'Ham Radio Operator' is certainly a play
on the word 'amateur'. The term was coined in the 1920s."

: Glenn Rogers WA5ZJK
: GRogers2@aol.com

It's not too bad, Glenn. One thing you might try if you haven't already... is to salvage the original. In saying you can save the old form, I would assume then that the mechanicals are intact? And, possibly the original just has an open?

I had a situation where I too had intact mechanicals but one of the bank wound coils had had something contact and break a lot of wires in one spot. Thought it was a lost cause but then another reader here suggested unwinding the coil until you get to the bad spot(s) and mend it. Sure, depending on how much wire you took off, the inductance will be different..but if you dont have to unwind too much you might be able to compensate with the tuning slug or condensor.

If you had to take too much off, you can mend the break and add more wire (yes, #36 etc. is small, but with patience it can be done.)

If you want to start over and have the form to work with, you can rewind the bank. Two banks would be more time consuming and difficult. I build an AM broadcast radio using AA5 bottles and wound my own bank-wound IF transformers and it works well. Knowing the IF frequency for the SX-117... you could then calculate the required inductance and then formulate the required wire size and number of turns for that particular form that you have saved, using dimensions Hallicrafters used. I have one of those "winding your own transformer" books gotten from the pages of Pop Elec etc...

Bank winding is not difficult, you just have to be patient when winding and not let the wifey unit distract you while counting (unless you set up some sort of coil-winding jig with a counter) :-)

I wound my coils on lucite rods and kept the wire in place with round, flat pieces of plastic at each end of the rod.

You can wind them directly onto your form using removable
flat round pieces of some material that doesnt flex much,
or wind them onto a rod of similar diameter with more easily
removably flat round guides and then after spraying or applying
some laquer or glue later tranfer to the original form carefully.

This works, but remember to add a layer or two of masking tape
to the rod so the inside diameter of the finished coils will
fit over the original coil form.

This is exciting stuff, folks. (yeah, I know....zzzzzz eh pe
pe pe pe....zzzzzzz eh pe pe pe)

Let us know how your project turns out. You're right about
the old Hallicrafters. It's not a lost cause at all!!

Your radio pal, Tony.

PS...remember to get the coupling between the primary
and secondaries right or your selectivity and performance
will be way off!

## 2541. Colorburst filter and LM386

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-11 00:00:00 UTC
From: wmeara@erols.com
Message-ID: <34187c11.75623705@news.erols.com>
Source record: 91109

With the help of Leon Heller, Tom Bruhns and others I finally built and
successfully installed a narrow, three pole CW color burst (3.579) filter in
my HB superhet.
Leon's formula provided the value for the shunting caps and I just copied
the termination circuits used in Doug DeMaw's "Barebones" superhet circuit.
I had to fiddle with the LC circuit at the filter's input (had to add some
capacitance to get it to resonate). I also had problems getting the BFO
frequency in the right place: When I put one of the color burst rocks from
the same batch (same freq) in the BFO, I found that it was way too high and
was producing an annoying high-pitched CW tone. Even with the series
"wiggle" cap shorted out, it was still too high. So I moved this trimmer
cap from series to parallel across the rock and was able to set the BFO for
a pleasing 700hz tone.

I used a batch of 50 xtals purchased from Dan's small parts.

The narrow filter really makes a big difference - the RX is now truly in the
"single signal" category.

Some questions: The three pole filter as expected has significantly more
insertion loss than the simple one rock filter that I'd been using
previously. To compensate, I switched my LM386N-1 audio amp into the "high
gain" mode (cap between pins 1 and 8). The amp is now quite a bit more
fussy and I had to do some pruning to avoid feedback. I also notice that
some AC ripple from the supply is more evident in the audio. What's the QRP
conventional wisdom on the 386? Is it worthwhile to run it in the high
gain mode? Should I back off on its gain and add another AF amp stage? Or

how about another IF amp to compensate for the increased insertion loss?

# 2542. kits for no code techs

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-11 00:00:00 UTC
From: dwayne rich <drichff@worldnet.att.net>
Message-ID: <5vaduu$4gu@bgtnsc02.worldnet.att.net>
Source record: 91110

My fiancee has become interested in ham radio and wants to know if there are any kits that she could build to get on the air once she gets her no code tech ticket? SHe has a desire to build rather than buy a rig. Building things shouldn't be a problem for her as she has a masters in electrical engineering. My only concern with her getting her license is that I will have to share radio time <grin>. Can anyone point me in the direction of kits to build?

Drift of one or more xtals may be the problem. Spray the filter with
Freeze it and/or heat it up with a heat gun (be careful). That might
provide some clues.

## 2546. Why would/wouldn't this work?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-12 00:00:00 UTC
From: Sean Dyer <sean@wubios.wustl.edu>
Message-ID: <01bcbf1f$58533230$5f9585ce@sean>
Source record: 91018

Why would or wouldn't this work?

1. Take a bandpass filter of ~10khz centered somewhere in the HF spectrum.

2. Amplify this signal

3. Sample this signal at say 30khz. (16bits * 30K=480kbps) By the sampling theorem this should be more than sufficient to completely represent the information contained in the passband.

4. Put this data on a high speed bus (SCSI etc) to a desktop computer. At this point by transforming to the frequency domain the passband could be arbitrarily narrowed and other more sophisticated DSP algorithms applied. (I'm assuming a pretty powerful desktop computer here)

5. Output to a decoding/demodulation process on same computer and render as sound, text or whatever..

For me the difficulty is in step 3, I think I have a vague idea of how the rest of the process could be implemented.

I'm curious what other people with more expertise and experience think about this idea. Do you think that it could be translated into a homebrew receiver? Has this been done before. I've read some discussion of commercial/military receivers that implement a similar design, how are they similar/different.

Thanks in advance for your thoughts.

A hilarious take. Only ham-operators are so dumb as to not be able to defeat any kind of so-called secure communications. Only strong encryption is out of the reach of us hackers. We program our own cell phones. What makes you think we cannot program our own trunking HT's to any city in the nation?

Tell the FCC they better start requiring real written exams for ham licenses. What a bunch of "multiple-choice" morons!

Dr. EMF

Rob: The filter is supposed to be about 250 hz wide. I think the
crystals are very close in freq. Some of the literature does talk
about adding IF amplification to compensate for insertion loss.
Doesn't seem to be a big deal here, but I do notice a difference when
comparing overall rx gain with the 3 rock filter as compared to the
simple one crystal filter I was using before.

What does this all mean ??? The antennas for MDS pay TV are already
about 12-15 inches !! Putting the Frequency up to 24GHz would appear
only to help attenuate signals better, and increase the reflector size and
make it solid instead of (what it is now) mesh ??

Hi Bill--

>That is technically not a balun, it is only an rf choke.

It's purpose is still the same--to break the low impedance path to the outside surface of the coax feedline, thereby blocking unwanted RF current flow. If it does the same job, why is it "only" a choke?

I used G5RV antennas for more years than I care to count, both full and half size, and never found that a balun helped much. You do however need an ATU to transform whatever wierd impedance turns up at the shack end of the coax to something near 50 ohms. Basically I think that the coax in most setups is actually part of the antenna!

I've never thought the LM386 was worth anything. Try an LM380 instead,
possibly with improved shielding and/or bypassing.

> Why would or wouldn't this work?
> (snip...)

Close, but not quite. If you want to process the RF, you must sample at a rate determined by the frequency of the *RF*, and not by the frequency of the modulation. Still a fairly tall order unless you're rich.

It is perfectly practical to create a receiver that converts a 10 kHz slice of RF down to, say, 15-25 kHz, and then pick it apart with DSP. Look for receivers that talk about IF DSP - it's not something marketing people keep quiet.

I'm researching this as a winter project, in fact. SD5400 front end, ADSP21061 backend. Just have to sort out the in-betweens...

That's MAR-1, etc.

Other than direct, you can get them from (at least) Down East
Microwave, Cirkit, and Mainline.

Mini-Circuits only sell them in packs of 10, but letting it
be known that you have some spare MAR-6s or whatever to give
away is your ticket to instant popularity. :-)

-Close, but not quite. If you want to process the RF, you must
-sample at a rate determined by the frequency of the *RF*, and
-not by the frequency of the modulation. Still a fairly tall
-order unless you're rich.

BZZZZZT!!

Sean Dyer's idea is valid (at least in theory). It is only necessary to sample at twice the bandwidth of the signal of interest (assuming real samples). This technique is known as subsampling and is often used. RF folks can view the sampler as a (frequency) mixing operation.

Of course, there is a catch.

The A/D converter only needs to handle the 10KHz signal, but the sample-and-hold
that preceeds the A/D must be fast enough to grab the RF signal.

Fast A/D converters are fairly easy to come by today; often the problem is moving
and processing the data. Get a converter with built-in S/H function that is fast enough to sample the RF, but clock it at 25 to 30 KHz (for the 10KHz example).

Also, the sampling freq needs to be chosen so that the passband of interest is not inverted or rotated.

: sound, text or whatever..

: For me the difficulty is in step 3, I think I have a vague idea of how the
: rest of the process could be implemented.

Yes, sampling accurately is a serious problem. Let's say the IF is 10MHz,
and you are sampling signals that are 1 volt peak. Then the slew rate
of the signals is nominally 62 volts per microsecond peak, and to sample
without distortion, you need to switch from "track" to "hold" with a
delay time that is independent of the signal amplitude. It can be done,
but...how do you do it to sufficient accuracy, at a price hams can afford?

My preference is to convert to a very low IF, say 15kHz, and do quadrature
conversions; then digitize in a stereo ADC and demodulate digitally. The
data rate and demod calcs are demanding enough that I'd just as soon do it
in a DSP external to the computer. You can get a DSP evaluation board
with stereo 16-bit ADC and DAC (CODEC) for around $100. If you get the
Motorola DSP56002 EVM, it would be relatively easy to upgrade it to a
24-bit ADC, and you wouldn't need any AGC then...the ADC would handle from
noise-floor to mixer compression point. By using delta-sigma ADCs, very
little in the way of filtering is required at the "IF". But by using an
IF in the high audio range, you get out of at least most of the 1/f noise
in the mixers.

I _hope_ to find time to play with these ideas seriously over the coming
months, but know that others have done similar things.

I really don't feel like getting into a nit-pick contest, but the ARRL
Antenna Book (at least the 17th edition, anyway) calls it a "balun", in
addition to calling it a "choke balun." If you have any words of wisdom
for Dimitris about using what is technically a balun on his G5RV, why not
pass them on.

Thanks for the reply. I know about the modulation the servo
itself uses from the comp.robotics.misc FAQ. It is PWM,
where a 1 ms pulse is full left rotation, and a 2 ms pulse
is full right rotation. Each pulse is separated by about
20 ms.

Most transmitters have at least 2 servo channels. Some use
AM, some FM, and some PCM. I'm guessing that an AM system
just multiplexes the pulses from each channel together in
time, and transmits them. Then the receiver demuxes them
and sends each pulse to the right servo.

If that hunch is correct, how does the receiver sync
with the pulses, so the correct pulse goes to the correct
servo? Does it just wait for the dead after all the pulses?

Do the different radio manufacturers use their own schemes
for this, or are they standardized? Thanks for any help.

I appreciate everyone's suggestions of kits. She hasn't ruled out CW
)I talked to her about it tonight). She made the comment that she
wanted to enjoy the hobby with me not compete with me. She is definitely
one of the greatest. I bought her the now you're talking book so she
can read some of the rules and operating priveleges. I don't think she
will have trouble with the electrical theory part as she helps build
computer chips for a living. She did mention that if she got into it
and really enjoyed the hobby and wanted to make long distance contacts
she would work on her code (i haven't given up on her learning the
code). It only took me 4 months to bring her around to an interest in
ham radio. I took the easy approcah not the hard sell. Worked like a
charm. At least that is what she has allowed me to think <grin>

"Ham actor" doesn't necessarily, or even ordinarily, mean *amateur* actor.
It is more generally applied to actors who overact and chew on the scenery
or otherwise attempt to puff their part and grab the limelight from the other
actors. This is called "hamming it up" in the business, and there are a number
of notorious ham actors in the professional acting ranks.

There *is* a certain tendency among amateur radio operators to puff up
their part, IE their self-importance, so there may be the seed of truth here.
It seems unlikely that radio amateurs would want to label themselves in such
a way, but stranger things have happened.

The rf beads, or forming a coil of the coax, will indeed block unwanted
RF currents on the feedline, however a balun does that and more. Coax
feedline is an unbalanced feedline, most antennas, such as a dipole, are
balanced antennas. So, you are feeding a balanced antenna with an
unbalanced
feedline. This means that one side of the antenna is connected to ground
through the outside shield of the coax which upsets the symmetry of the
antenna. A balun, which the word is derived from "balanced to
unbalanced",
accomplishes the job of coupling the balanced antenna to the unbalanced
feedline, maintaining the symmetry.

Take a look in the Jameco Catalog, just a year or so ago I saw both the
transmit and receive chip, a friend who had used them said you only need
to provide a carrier for tx and the detected audio from a receiver to
make it a work. The chips were about $6 ea.

In many situations a coax feedline choke is just a choke, and it makes no balanced-to-unbalanced transformation. But in a different situation the same choke can be acting as a balun as well. It all depends what you're using it for.

When used at the feedpoint of a center-fed dipole, the feedline choke on the coax is acting as a balun. It's still a choke, but here it's behaving as a balun too. Roy Lewallen calls it a "current balun" and if you read his article in the 1st ARRL Antenna Compendium there is no doubt blocking the outer-surface current on the coax accomplishes the balanced-to-unbalanced transformation.

Bill seems to be reserving the term "balun" for a different kind of device, probably the one with multiple interconnected transformer windings (what Lewallen calls a "voltage balun"). This aims to do exactly the same, but it doesn't do anything more. It only does the same thing with more complexity - and sometimes does it less well than a choke.

Haven't seen this in "well designed" circuits as there is a buffer
between the osc and the mixer stage. even with the old tube tupes that
used a 6U8 triode/pentode the circuit contained a choke to limit the
harmonic output of the osc stage..
But this filtering, even in well designed circuits is minimal to say the
least. Because of the tuned RF amp stage(s) and the tuned IF any benefit
gained by filtering out harmonics at the osc or mixer stage would not be
cost effective.

Source record: 90968

Hi Folks,

I need to obtain a transmitter/reciever or schematics for a transmitter/reciever. I only need to send a signal about 50 feet. I must be able to tune a transmission to a certain frequency and then bandpass that signal at my reciever. I need to send two or three different frequency signals at different times. Where could I buy such a transmitter/reciever unit or obtain schematics. Please Help.

Also, what would be the best frequency to transmit over this short range to avoid interference from outside signals?

Generally low-pass filtering is added before balanced mixers, since
harmonic content (odd order, I believe) can throw the mixer off balance,
and cause excessive radiation of the LO out the rf and IF ports and
resultant IMD degradation.

Note that this really has nothing to do with harmonics per-se, because most
high level mixers are operated in a switching mode, and generate harmonics
themselves. Its all just about balance.

Rob.

## 2586. Fox hunts?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-13 00:00:00 UTC
From: GZGQ49A@prodigy.com
Message-ID: <5vf348$1062$1@newssvr03-int.news.prodigy.com>
Source record: 90972

Hello everyone..... I was wondering if there is any groups on USENET
dealing with foxhunts and/or suggestions for the "hunt" of the "fox".
Our club has been doing this for about
two years now but we seem to be stuck in a rut! We do the same thing
every week and seems to be no energy or new ideas.
I am going to try a 19" parabolic dish
next week with an R/C network for attenuation. Thinking of a RDF
electronic switched but not sure of all the details.
Any suggestions would be super and
maybe we need a newsgroup here for the elusive fox!

Hi Bill--

>This means that one side of the antenna is connected to ground
>through the outside shield of the coax which upsets the symmetry of the
>antenna. A balun, which the word is derived from "balanced to
>unbalanced",

The DC path may be to ground, but not the RF path (review inductive reactance). Following your logic, chokes would be superfluous to RF design because they would simply allow RF current to pass unimpeded. Yet this isn't what happens.

From: Sir Robin <nexus15@flash.net>
Message-ID: <341B19E7.6287@flash.net>
Source record: 90974

Has anyone ever used the 49 MHz. 2 way headset units that are sold by RS and others as a wireless microphone and headset interconnect for an amateur fixed station setup? How about infra-red 2 way?

I am interested in hearing about the particulars of such setups.

Any kits of this type of unit available anywhere?

Thanks...Rick...W5RH

I have trouble beleiving that it works but appentily it is possible to very tightily bandpass the frequencies of interest and they use sample ailiasing to your advantage. There is a paper on the subejct from MIT at

http://www.tns.lcs.mit.edu/publications/MCN-95/MCN-95.html

which uses a $30K work station to replace a $5 FM radio not necessarialy a great idea but they claim it works and is a major technological breakthru although I think the $5 radio would be easier to carry in my pocket.

# 2592. Re: VFO harmonics

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-13 00:00:00 UTC
From: Michael Black <blackm00@CAM.ORG>
Message-ID: <Pine.GSO.3.94.970913123925.24582A-100000@Stratus.CAM.ORG>
Source record: 90978

You're right in that we often don't see filtering between the VFO
and mixer.

The resulting problem wouldn't be loss of gain, but that you'd
be receiving spurious signals because incoming signals (other than the one
you really wanted to hear) would beat against the harmonics of the
oscillator and the resulting product would land in the IF.

SOme oscillators are obviously better than others in cleanliness. I
can't help but think of some low end commercial receivers of days gone by
that were plagued by spurious signals, and imagine that the oscillator
was not a good design (probably due to cost cutting).

I would also think that feeding an oscillator fed directly into a mixer
without buffering might be a problem, if the coupling method put so much
of a load on the oscillator that the purity was distorted.

Without having given it a lot of thought in the past, I imagine one
reason that filtering is not common between the vfo and the mixer is
a desire to keep things simple. If the filter is variable, it has to
be made to track with the tuning of the vfo. If a bandpass filter is
added, it has to be aligned to cover a segment of the spectrum, and if
you are covering different ranges, a new filter has to be switched in
each time.

I do recall seeing low pass filters placed between VFO's and mixers
in some articles in the past, and the author would mention that it
was to eliminate harmonics from the oscillator which would beat with
the obviously strong local tv and broadcast stations. These broadcast
signals are so strong that even when passed through good front end
filtering (or directly to the mixer in a receiver without good shielding)
they can still be quite strong.

Whether it's a problem or not in a given case depends on results.
If you're plagued by spurious signals in given receiver design, it might
be something to look into.

I have just finished my new keyer based on a Microchip PIC microcomputer I.C.

Check out my web page at:

http://members.aol.com/k1el/index.html

or e-mail me for a text only description.

Brief Description:

The K8 Keyer is a low cost automatic Morse keyer designed by Steve, K1EL
and implemented in an 8 pin Microchip PIC (TM) microprocessor. Only a few
external components are required to build a keyer using the K8 Keyer I.C.
The K8 provides directly adjustable sending speed, both callsign and
message memories, a built-in sidetone oscillator, straight key emulation,
and even a code practice mode

It is technically a choke-type balun. It is a choke and a balun at the
same time. It is a choke for common mode voltages and currents. It is a
balun for differential voltages and currents.

## 2605. VFO harmonics

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-13 00:00:00 UTC
From: ka8ddz <hynde@flash.net>
Message-ID: <341AD055.7E3A@flash.net>
Source record: 91059

There is alot here I dont understand but Im trying. I have noticed in some of the simple receiver schematics that there is generally not any filtering between the VFO and the first mixer.

I would think that a simple LC VFO would have some healthy harmonics comming out of it. My question is, if these harmonics are reaching the mixer are you not loosing some gain due to the amplification of these unwanted signals? Even though they get filtered out when you convert to the first IF, they are still present in the 1st mixer.

Would it improve things at all to have a bandpass filter prior to the VFO input to the mixer or am I worried about something that doesnt exist.

Source record: 91060

Hello all-

I'm looking for plans for a SIMPLE transmitter I can build with parts from old stereos and maybe $5 boughten parts. Hopefully it would work on AM or FM broadcast bands so I don't need to build a reciever, too. It needs to reach 2-3 miles and be legal without a license- I'm not the pirate ham type.

As an alternative, could I put a linear amplifier in a CB walkie talkie (I have a pair, ~ 1/2 mile range) to boost the range?

I realize I'm asking about non- ham bands, but this ng is the only one I can find re: home brew radio. I've spent 3 hrs searching the www and found only ham band radios.

TIA-
Harley Tuck

Here is a list of Equipment that I have for sale. Getting relocated by my company and clearing out the shack

TEST EQUIPMENT
Wavetek 3000B Service Monitor $2,000
Motorola mobile test set with micor/mocom/cables $75
B&K 1471B 10Mhz dual trace $125
Jackson Audio generator $50
Bird 6254 Termaline watt meter (low power) $100
Pace Portable desolder station 110vac & 12vdc $300
Fluke 8040A Bench/portable DVM $85
Eico 232 VTVM $15

RADIO EQUIP
Mastr II 36 inch cabinet exec. cond $150
Ritron 30-50 Mhz portable $40
MX 320 UHF 2 watt port $75
MX 340 UHF 5 watt/PL $50
MX rapid charger $50
MX speaker mic $20
GE MPX UHF port $50
Mastr II 40watt mob "E" case with CG & assories $150
Mastr II Duplex "E" case (great for making repeater)
Trielectric UHF repeater power amp. 10-20W in 100W out $250
TPL repeater power amp 5w in 80 - 100w out $125
Sinclair UHF duplexer 4 cav pass/rej $300
DB UHF duplexer 3 cav pass/rej $275
DB UHF duplexer 4 cav pass/rej (brand new) $550
DB UHF duplexer 6 cav rej only (brand new) $500
Bramco multi-function DTMF decoder 19" rack mt. $75
Kenwood 30amp DC power supply. $125
D104 mic with amp. $40
Turner +3 mic with amp $30
Misc GE & Mot Parts
HAM GEAR
Kantronics KAM TNC $100
HF low pass filter $25

# 2610. Re: Why the term ---HAM---

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-14 00:00:00 UTC
From: "Gregory T. Helding" <gth@execpc.com>

I read that the term was first used in a telegraph operator training guide.
A ham (not an acronym) was a bad or inexperienced operator. This was
before radio. When radio came about, there were not the regulations and
restrictions we have today, so people operated wherever and however they
wanted. The troublesome operators were called hams by military operators.
This name stuck and eventually the term came to mean all amateurs, not just
bad ones.

Yep, that's what a choke, also called a current balun, does all right. A voltage (transformer) balun does the same thing, though not quite as well. The choke balun only supplies a 1:1 impedance transformationn while the voltage balun can support other integer ratios. But if you don't need that transformer action, the choke balun is better.

A choke balun forces equal (but opposite) currents into each leg of the antenna while a voltage balun only supplies equal (but opposite) voltages to the antenna feedpoint. If the antenna has equal impedances in its two legs, the net effect is the same. If it doesn't, the choke balun will be better because it is current which makes an antenna radiate, and a nominally balanced antenna should have equal currents in the two halves of the driven element.

Coax is actually a 3-wire feedline. The currents on the inner conductor and the *inside* of the outer conductor are equal and opposite. So in that sense, coax is a balanced line. It is the third conductor which unbalances it. That third conductor is the *outside* of the outer conductor of the coax. The choke balun breaks this RF path, which leaves us with a balanced feed to the antenna. So the choke is indeed a balun.

Gary Coffman wrote:

> It is the third conductor which unbalances it. That
> third conductor is the *outside* of the outer conductor of the coax.

This is not always true. In a two-wire line the unbalance can occur even if there is no stray pickup source. The forward current in one wire may not be equal to the return current in the other wire. For example the Zepp feeder. There are many other examples.

And this is also true for a coax. The common folklore that the return current in a coax braid is *always* equal to the forward current in the center wire is just that, folklore. It is very easy to divert some of the return current to the generator through an alternate path. It happens quite often, not only in antennas but in the many other areas of circuit design where baluns are used to correct this problem.

The idea keeps popping up on this forum that the unbalance (common mode) is due *only* to stray pickup from antenna radiation, etc. This is definitely not true. And the choke balun's mission is much more than to correct this one problem.

My article in July QEX deals with this topic in greater detail.

Bill,

How "easy" is it to divert this current?

If the current on a coax's 'inner' shield surface is 'forced' to equal
that of the center conductor (but opposite direction), doesn't this
mean that *all* of the return current returns via the shield inner
surface, and not through an alternate path?

Admittedly, there are frequency vs. coax length limits where these
currents may not be equal (a topic I need to bone up on!). Aside from
these limiting conditions, under what conditions is the current on the
inner shield not equal to the current on the center conductor (i.e.
some amount is diverted)?

Hello,
I've heard mention of "micro-broadcasting" while listening to my
shortwave radio. Apparently, it has something to do with ordinary
people who legally use very low power to transmit some sort of voice
(narrow FM?) signal in their local area.

Do any of you have a list of common frequencies for this? Is it indeed
narrow FM - or is another modulation used?

Just curious. Thanks in advance.

Nope! thats not it! What they mean is transmitting on the AM/FM
broadcast band at low power levels. This is NOT legal. But its done
all the time by a good many people. Check out alt.radio.pirate for the
real information on the subject.

## 2623. FT-51R Help Needed, Plse.

Source record: 90995

After doing wide open mods and undoing them, my FT-51R is stuck in Euro mode. I know that I can get very wide band TX/RX if I unsodler (again) the pad and resetting. Problem is, my software won't load into the radio if I do that. Is there anyone out there that can tell me how to get my HT back to normal USA mode without sending it to Yaesu? VHF shows band 5, and I no longer have band choices. Can anyone help. Thanks, Scott (KB5YOK)

There have been some successful attempts at down converting higher spectrum information to the limited B/W of the older scopes. For example the 3.5-4 Mhz spectrum could be selectively down converted to the 0-500 Khz spectrum of the old HP 130s and the like and be useful for looking at some stuff. Does not resolve the B/W limitation or make the scope respond any faster to a signal or pulse in a fast time domain, but in some limited cases a simple down converter would allow one to look at narrow band singles such as transmitted signals and some IF signals on a cheap or old machine. Perhaps some of the mates could point to a commercial extender or reference a home made project that would accomplish the task.

>the first IF, they are still present in the 1st mixer.

Many diode ring DBM seems to work better when fed by a square wave
with steep edges containing a lot (odd) harmonics. Unfortunately,
these harmonics mix with the upper part of the input spectrum and some
mixing products will fall within the IF passband. Thus, general
coverage receivers usually have (sub)octave filters in the RF
amplifier to reduce the input spectrum that might mix with the
harmonics of the local oscillator.

>Would it improve things at all to have a bandpass filter prior to the
>VFO input to the mixer or am I worried about something that doesnt
>exist.

If you are building a simple receiver for a very narrow band, say the
CW segment of a single amateur band, a better place would be to put a
bandpass filter between the antenna and the mixer, limiting the input
spectrum to the part of interest, thus helping the perform a bit
better. This is important in particular with simple (unbalanced)
mixers.

The situation is quite different with general conversion receivers or
dual conversion receivers, in which the harmonics of the VFO can mix
with other oscillator frequencies (and their harmonics).

Cross-posted to: alt.radio.scanner,alt.radio.scanner.uk,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.space,rec.radio.scanner,rec.radio.shortwave

FTV (now in Version 1.0)can be used to receive images from Weather
Satellites and Terrestrial Facsimile Stations, text transmissions from radio
telex services, Morse code, as well as Amateur Radio FAX, SSTV, RTTY and CW
signals. It can also transmit Amateur Radio FAX and SSTV. No external
hardware, other than a radio, is required, as all the necessary signal
processing is implemented in software. The main features include:

WEFAX, FAX, SSTV, colour SSTV, RTTY and CW operation.
Transmits 6 FAX modes, 8 monochrome SSTV modes, 10 colour SSTV modes.
FAX operation supports APT signal recognition and scheduled reception.
No external decoder or converter box is required.
Signal analysis is provided on all modes.
Many parameters are adjustable while receiving.
Full recovery from wrong mode settings is possible.
Program works in real time (about 1 second 'DSP' time lag)

You may get more information or download a copy from my web site, on
http://www.geocities.com/SiliconValley/2504

Believe it. I used that technique to sample and demodulate the 100-kHz IF output of a TS-930 with a standard stereo codec. Worked just fine, although limitations of the S/H in the codec would have kept me from doing the same thing at say, HF.

Hi Rod,

I like to hide the fox in an area with lots of metal to bounce off.
Another trick is to use a directional antenna to bounce the signal off a large reflector/ re-radiator.

>
>Can someone explain this?

Essentially, you look at the steepest part of the sine wave, which is the zero-crossing. The slope there is 2 times pi times the frequency in Hertz times the peak-to-peak voltage.

Figuring this out takes a little calculus. The signal is (1V) * sin(2 * pi * 10^7 Hz * t). You can find the slope by taking the derivative and evaluating it at the point of steepest slope (conveniently, one such point is at 0). The derivative is (1V) * 2 * pi * 10^7 Hz * cos(2 * pi * 10^7 Hz * t), which at t=0 gives 6.28 * 10^7 V/sec, which is 62.8 volts per microsecond.

>Track? Hold??

A device that samples and analog signal at discrete times is called either a sample-and-hold or a track-and-hold. The device has two states: track and hold. In the track state, it passes through the signal to its output. Its output "tracks" the input. In the hold state, it holds the signal's level at whatever voltage it had at the time of the track-to-hold transition.

The distinction between a track-and-hold and a sample-and-hold is somewhat arbitrary and vague. The definition I like is that track and hold is designed with emphasis on tracking accuracy and short hold times, while a sample and hold is optimized for short track intervals and long hold intervals. The terms are somewhat interchangeable and the distinction vague, so you'll find people that prefer one term to the other for all circuits of this type.

There seems to be some confusion as to the difference between
sampling lowpass bandlimited analog signals, and bandpass-limited
analog signals, and that is no real surprise, as many DSP and
communications courses and textbooks seem to dwell on the point
of Nyquist sampling, without discussing the fact that it might actually
be DESIRABLE to alias a signal. Here's my brief attempt at something
beyond "believe it."

Notice that the original poster defined his problem so that he was
only interested in a 10 KHz. portion of an RF signal. If he had wanted
ANY frequency out of the original RF, then he would indeed have to
sample at least twice the frequency of the highest analog component
for full recovery. If what is really wanted is a narrow bandpass
component only, then one can use signal aliasing, AKA the Bandpass
Sampling Theorem, and this is what Jon is using as described above.

According to Communication Systems by Carlson, define the signal
of interest as bandpass, existing from fu-W to fu. In other words,
fu is the uppermost frequency (highest), and the signal has bandwidth
W, thus the lower frequency is fu-W. (The artwork is left as an

exercise to for the student - I stink at ASCII art...)

The required sampling rate is fs = 2fu/m, where m is an integer that satisfies - (fu/W)-1 < m <= (fu/W) (<= is less than or equal to).

Try a few examples. The most obvious place to start is the LOWPASS case. Here, W = fu, so the lowest frequency is fu-W = 0, DC. Substituting, (fu/fu)-1 < m <= (fu/fu) which is 0 < m <= 1, so of course m must be 1. But since fs = 2fu/m, fs = 2fu. This is in agreement with Nyquist, as it should be.

Now what happens for a bandpass signal? Try the equations for fu and W = fu/2. Now (fu/W)-1 < m <= (fu/W) becomes (2-1) < m <= (2), so m equals 2. Plugging this into the sampling frequency equation, fs = 2fu/m gives, fs = fu. We are now only required to sample at the highest frequency value, not TWICE it!

Try one more, this time W = fu/4 (a narrower bandpass by a factor of 2 from above...). Now (fu/W)-1 < m <= (fu/W) becomes (4-1) < m <= (4), so m equals 4. Now, the sampling rate is fs=2fu/4, so fs = fu/2, or HALF of the highest frequency!

As you can probably see, the sampling frequency for a bandpass signal is a function of the ratio of the highest frequency and the bandwidth of the signal. In the limit, as the frequency of the RF signal goes up (many MHz...), and the bandwidth goes down (only around 10 KHz. in this problem...), then the sampling rate will approach twice the BANDWIDTH of the signal, not twice the highest frequency.

Notice in the original posting that the author sort of arbitrarily said that he would sample at 3 times because it might be "better". This "oversampling" might be OK in lowpass Nyquist sampling, but one must be careful with bandpass signals, as the relationship is more complicated, and "oversampling" can create images and aliases just as easily as "undersampling".

As with all other things, this technique has its advantages and disadvantages. As Jon pointed out, IF processing using this technique is a really good idea, because low-price, high quality ADCs can be used. The disadvantage to designing a receiver front-end like this is that you obviously have to design a very good bandpass filter for the input, so general frequency coverage is pretty much out the window...

Hope all of this helps...

You can filter the heck out of the VFO feeding a DBM. It'll be clean as a whistle until you connect the DBM. The non-linear load of the diodes turning on and off generates harmonics all over again. (Assuming enough LO drive to turn on the diodes), but then, it isn't a mixer until you do.

In the interest of saving space in a very small box, is there any difference between using an NE602 as an oscillator or building one using a dedicated transistor with all the appropriate caps etc.

It would seem to me (while more expensive) an easy solution when you need a simple xtal controlled or LC oscillator. Thoughts?

Tim

Weeding through the digressive BS.....I think the bandwidth in the
Oscilloscope is determined by frequency responce of the vertical
amplifier components. By changing the components to those with a
higher frequency responce, logicaly it should increase the bandwidth.
Maybe this is an oversimplification on my part, but its the best start
so far.

Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment,rec.radio.amateur.misc

Hi,

I would like to build a mc68hc11 based morse code generator and decoder. My plans are to start with a dumb terminal or pc (in terminal mode) as the input to the microcontroller.

As the user types, morse code is sent to a speaker and or to a suitable output to be interfaced with a radio. Also, I would like to be able to use the hc11 to decode incoming morse code and display it on a pc or built in lcd display.

I know this probably been done to death, but I am having a tough time locating c, c++ or assembly code and algorithms. I would also like to see any hardware info if it is available.

I have been out of ham radio for some time, so I thought this would be a good project to start with.

I can use the information even if it is not directly for the hc11, any related information will be helpful. I am using linux and win95 and am not particularly interested in doing this via sound card, though the software may be of some help.

Thanks,

KD9GN@vnet.net

p.s. feel free to cc my email on any responses.

rec.radio.amateur.boatanchors,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.swap

I have a BRAND NEW in the box 5CX1500 Eimac tube that I bought a few years ago for when my Henry 4K needed a new tube. I sold the amp (working just fine) with the old tube in it and never needed the NEW tube.
It runs over $1300 new from Eimac.
This tube has been and is still in the possession of Ted Henry of Henry Radio. I kept it there because I thought I would put it on consignment. Well they no longer do Ham Radio as a retail business, so I offer it here. You can call Ted and he will vouch for this tube!

I ask $475 plus shipping.

If you're tired of duds or other junk tubes, you will be pleased to solve your tube problems with this NEW tube. Probably last as long as you do!

73, Dan

Yes, this is exceedingly common. Folks who want to become
"micro-broadcasters" buy baby monitors, cordless phones, and cellphones.
Each such broadcaster typically has a half-dozen or so listeners
who are kept entertained in their neighborhood.

Among the most popular broadcasts are local politicians, government
and school employees who regularly make their entire personal lives
available to whoever may want to listen. You may have read about
how Newt Gingrich recently opened his own station.

Vintage Radio Kit Co. announces the hot new CAKEPANION regenerative receiver kit to go with their popular CAKE PAN CW-5 transmitter kit!

More to come soon, including the BREAD PAN antenna tuner kit!

Enjoy ham radio like in the old days!

For a complete description of these affordable CAKE PAN KITS(!) take a look at:

http://www.mnsinc.com/bry/vintage.htm

ENJOY!

>all the time by a good many people. Check out alt.radio.pirate for the
>real information on the subject.

Using Ramsey FM-10 under Part 15 is LEGAL to transmit on the FM band.
Those using MODIFIED FM-10's, amplifiers etc. then would exceed the
power levels allowed under Part 15 and would then be ILLEGAL to use
MODFIED/AMPLIFIED/EXTERNAL ANTENNAS etc. to transmit on FM with out am
FM broadcast license under Part 73.

Don't classify all FM-10 & similar devices as illegal. Many such
devices are on the market to relay portable CD audio your car stereo
etc.. These devices when used PROPERLY are LEGAL.

so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sept. 21st, 1997
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >1000 cars!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Seperate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Not if you exceed the "field strength" requirments. And with a tunned dipole you will. You can run 1Kw on the FM broadcast band as long as its into a good dummy load. Hook an FM 10 to a beam with a nice 8 Dbd gain. You'll hear it for a mile. The FCC wouldnt like that....73

Hi Tim

>In the interest of saving space in a very small box, is there any
>difference between using an NE602 as an oscillator or building one using
>a dedicated transistor with all the appropriate caps etc.--

I think there are arguably at least two important advantages to using a single transistor in a seperate VFO over using the "on board" NE602 oscillator. One advantage is better level control between the oscillator and mixer. If the oscillator is external, you can easily control injection level (like most Gilbert Cells, the NE602 turns ugly when it is overdriven). If you use the chip's internal oscillator, the only way to control injection level is by carefully limiting feedback in the oscillator tank's capacitive divider. Also, when you use the internal oscillator, there's no way to filter out the oscillator harmonics. In receiver mixing applications, these can be troublesome--causing spurious responses.

Having said that, I've found that if I monitor what I'm doing with a spectrum analyzer, I can achieve useful results using the internal oscillator in even the simplest NE602 oscillator circuits.

It works great Tim. I built one up 10 meteres and put an antenna
on it and could hear it about 700 yards. The only real problem is
the output impeadence it 2,000 ohms so you have to do some
matching to get it down to usable levels.

Writing code to send Morse is not difficult I'll be glad to send you some.
It is the decoding it that presents the problem. This is referred to as a
difficult problem. As far as I know there are no algorithms that approach
what a person can do on non synchronized CW.

The only way I can think of to do it is to save the high and low states
until
you decide you have a letter and then process the states into dots and
dashes
and look up the letter in a look up table. The trick is when do you have a
complete
letter. Not real difficult if a computer is sending code but near
impossible when
a human is running his letters together a little bit.

Good Luck

Again as I stated UNMODIFIED, UNAMPLIFIED, STOCK FM-10 is 47 CFR 15
LEGAL. A MODIFIED/AMPLIFIED/EXTERNAL ANTENNA is **NOT LEGAL**.

I would consider "micro broadcasting" to be the use of a LEGAL FM-10
or similar product. As the power is definately in the micro power
level.

Also, a lot of designs did not have adequate screening, so stray coupling around a wonderful IF filter spoilt the ultimate rejection.

I began to suspect some years ago that the penetration of variable filter width and offset schemes into progressively lower in the market oriental transcievers was not an outbreak of creeping featurism, but was actually a way using frequency translation as a way of minimising the metalwork needed to screen the huge amount of gain in their IFs.

An IF with distributed gain and distributed selectivity still has a lot going for it...

Cheers

The Collins 75S3-B receiver, when it first appeared, had this problem. The culprit was a plastic shaft on the mechanical filter rotary switch. I replaced the shaft with a grounded metal shaft and the ultimate attenuation improved by better than 20 dB. We quickly put this fix into production.

You're right, Jim!

The 465 and 465B are incredibly good instruments. And I think you're right about parts being available for a while to come. I hope so! There were tons of those things sold to the government and big companies, and I think that as they surplus them they'll just keep getting cheaper and parts will indeed not be a problem for a long time. That's basically how the story ran on the 500 series Tektronix instruments.

And when it comes to oscilloscopes, there's Tektronix, and then there's everything else..... :-)

Good advice!

73, Tom AE5I

Hello,
before this thread I had heard of three explanations for the term
HAM. This thread has had all kinds of variations on those three. What
gets me is the willingness no focus on the negative definitions, I don't
deny there are poor operators in the amateur ranks.

there is no absolute definitions of the term HAM, why worry about it?
If a none amateur asks for a definition, what's wrong with replying.
There is no verifiable answer, it's only a nick-name. IE; roughneck,
swamper and so on?

Also, local oscillator (any one of a multi-conversion rx) and BFO phase noise close to carrier will degrade snr at narrow bandwidths and low tones.

In the past I have several times seen the following explanation of where "ham" is derived. In short, 3 early 1910's technicians has set up a transmitter. When the new rulings came in they asked to keep the system on the air and their initials (H.A.M.) was used to name that the users of those allocated frequencies.

Behold brothers and sisters, I bring you the profound story of how King Mackey the Great became so. It is an exciting tale filled with wonder, awe, and heroic deeds. Come closer, as I relate this grand history.

In the land of Scannerdom, the county of Power Supply was plagued with a terrible injustice. The evil mercenary force from Capacitor held the people of Smoke prisoner. Repeater, the ruler in exile of Power Supply, offered a rare and unused Radio Shack battery card to anyone who could free the people of Smoke from their Capacitor prison. A young and fearless warrior stepped forward to take up the gauntlet. Repeater told him of the dangers but the young man was undaunted and resolutely set off to free them.

When he arrived at the gate, Mackey was challenged by the fearsome guardians, Positive and Negative. So terrible were these mighty sentinels that even the renowned guardian Cerebus trembled when faced with Positive and Negative. Armed with his trusty screwdriver he didst battle with them. In the hands of a true warrior the screwdriver is no common weapon. Our hero, battle tested and proven in the labs and urinals of Technical School, was much more than a professional. He was a Grand Master of the Number Two Phillips Blade.

The guards fired spinning hex nuts and sliced with the dreaded razor sharp quartertwenty threads. Again and again, using every feint, lunge, and parry the guardians had learned in centuries of defending the cabinet, but to no avail. Mackey maneuvered himself and with one swift strike, he ended it. He had touched both guardians in the only way to kill them. He bridged the gap between them in a move only a Master Bladesman could execute, the Short.

The Capacitor force exploded from the cataclysm releasing the Smoke from their electrolytic bondage. Afterward, the Smoke rewarded Mackey with their highest honor, the Diddler of the Spark.

Mackey, hoisted by his own petard, began the journey home. In the land of Recdotradiodotscanner, he was attacked by the Legions of Ennui. These were no ordinary warriors, but elite shock troops. Armed with the latest in Apathy, Disdain, and

Contempt, they lay seige to our hero.

For months, a battle of attrition was waged. One after another, mighty warriors all, they fell. Even I, your humble scribe was a soldier in the Legion of Ennui. Alas, I too, fell before the great Mackey. No one could understand how a single man could withstand such an onslaught as we heaped upon him. Then we learned the source of his great strength. He was the most favored disciple of the malevolent gods, Fraud and Liar. They had taught him the secret fighting languages of Turpitude, Innuendo, and the most deadly of them all, Obscenity. Under their smutty tutelage, he repeatedly repeled the attacks with adroit displays of oratorical onanism.

There was a point in the war when we thought we were going to prevail. We had Mackey surrounded, he was in everybodys kill file, and his ISPs were terminating his accounts as fast as he could login. He had been beaten back to where he stood alone, armed only with a 300 baud modem and a Commodore 64.

Sadly, we all were victim to his great strategy and now he sprang his most devastating weapon. Surrounding him with our keyboards poised for the final death blow, he hoisted his hands above him. Like Moses bestowing the Ten Commandments to the chosen people, in his hands his mail-order diploma proclaming him Master of Communication Technology smote us down.

Cowered by the supreme Divinity before us, a hush fell upon the surrounding army. The only sound was a muffled cough from one of the younger soldiers. We lay prostrate on the ground before him, fearful of his wrath. Who were we to show the temerity to challenge his divine turgescence. We waited. Slowly, he walked through the defeated masses, and went home.

Upon returning to Scannerdom, he found word of his great deeds had preceded him. He was declared Supreme Grand Master Fool of the Universe and the people clamored for his ordination as King. In response, the Church of Scanner Mods proclaimed him King and the great sage and visionary Pope Bcheek presided over the coronation. As he placed the Discone Crown upon his head, he spoke the sacred papal blessing, "This boy reeks."

So there you have it, brothers and sisters. Behold the saga of his fetidness, King Mackey the Great, Ruler of Torpor, Supreme Grand Master Fool of the Universe, Grand Master of the Number Two Phillips Blade, holder of the Diddler of the Spark, Divine Master of Communication Technology, High Priest of the sect of Fraud and Liar, and Orational Master of Turpitude, Innuendo, and Obscenity.

All hail King Mackey the Great.

I am confused- what do scanners have to do with classical amateur radio-
which got along just fine before this relatively recently introduced
device came on the market.
I am not sure what is meant by wide-banded ham gear, but if this is
just the stuff well suited to transmission OUTSIDE the legally assigned
ham-bands, I can't see why a real ham cares. This is stuff for the CB
"free-banders", pirates operating in the short-wave bands and the like.
It is also the stuff which makes enemies for the ham community.
I would object if reception is limited to only ham frequencies.

Bob

PS I have trouble with terms like "serious Damage" and "vicious pack of
poison" if the above interpretations are correct.

Hi Bob, maybe a specific question will shed some light. Will this bill
make my general coverage IC-706 illegal? Out of the box, it will
legally receive portable phones around 47MHz if I remember correctly.

We received an outstanding response to our first "call
for articles," and now it is time to do it again.

QST magazine is looking for good material to publish,
from hams and nonhams alike. We'll consider almost anything,
from simple "evening" projects to complex discussions of
radio science.

We pay, too! Not enough to finance your car or house, but certainly
enough to help pay for some, if not all, of the parts that go into your
project. (Why snitch from the household kitty?)

To submit an article for consideration, send it to:

ARRL
Attn: Paul Pagel, N1FB
225 Main St
Newington, CT 06111

or e-mail a copy of article *idea* to:

ppagel@arrl.org

If you need an Authors' Guide, you'll find one at:

http://www.arrl.org/qst/aguide/#QST

Photographers: We're always looking for QST
cover material. Before sending your photos, check
out our requirements on the Web:

http://www/arrl.org/qst/cover_photo.html

My July QEX article (I know you have a copy) explains this very explicitly. It is very easy.

>
> If the current on a coax's 'inner' shield surface is 'forced' to equal
> that of the center conductor (but opposite direction),

It is not "forced to be equal". That is the folklore that I am objecting to.

If there is any kind of return path external to the coax that has a lower impedance than the return path through the coax then some of the current will not return through the coax. My QEX article gives a good example of this. It is a real-world example that I have seen many times and it is easy as pie to demonstrate. The balun is used to minimize this problem. That is one of its main functions.

Here is the way I am sure it is:

If the load at the far end is completely floating off of ground, and if the return path through the coax is complete (not open-circuited) then all of the forward curent will return through the coax. Otherwise, all bets are off.

## 2693. [?] Low-noise analog adder design

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-17 00:00:00 UTC
From: John Miles <jmiles@pop.removethistomailme.net>
Message-ID: <34203C27.7C2C@pop.removethistomailme.net>
Source record: 90874
Cross-posted to: sci.electronics.design;,sci.electronics.misc;,alt.engineering.electrical;,rec.radio.amateur.homebrew

Wondering if anyone can offer any suggestions on the following problem.

I'm experimenting with a very simple homebrew PLL circuit based around a VCO running between 770 and 1290 MHz, using a 3-5 MHz DDS as a reference clock with a fixed division modulus of 256. This will ultimately serve as the first LO for a general-coverage VHF/UHF receiver project.

One of my design goals for this PLL is extremely fast settling time, on the order of 1 ms or less for any frequency step in its range. Currently, I'm able to achieve this goal by "pretuning" the VCO with a DAC0801/LF356 combination which generates any of 256 desired voltage levels between 2 and 10 volts in response to a command from my PC parallel port interface. The LF356 serves as a current-to-voltage converter to turn the DAC output into a positive pretune voltage. The resulting pretune voltage is summed with the (scaled) output of the 74HC4046 PFD's passive-lag loop filter, and fed to the VCO tuning line.

Briefly, in the normal positive-output circuit from the DAC0801's data sheet, the op-amp (LF356 in my case) is configured with its + input tied to ground (along with one of the DAC0801 output pins), with the other DAC0801 output pin tied to the LF356's - input. This node is connected to the op-amp's output via a 10K resistor, across which the DAC0801 develops its output current. To perform the summing/scaling operation, I modified the data-sheet circuit by inserting a 5K potentiometer between the LF356's + input and ground, with the output of the VCO loop filter feeding the top of the potentiometer via a separate unity-gain voltage follower (another LF356). The potentiometer then acts as a convenient node from which to control the overall PLL loop gain -- essentially, it attenuates the control signal from the loop filter and forces the DAC's current-to-voltage converter to add the result to the VCO pretune voltage. By using the DAC to pretune the VCO to within a few MHz of the desired target frequency, the loop has no trouble locking within a few hundred microseconds. Loop stability is excellent because the potentiometer can be used to reduce the loop gain to the minimum necessary -- of the 0-5 volt signal from the loop filter, only 100 mV or so of control range is actually needed at the + input to the op-amp that drives the VCO.

This all seemed to work very well, until one day I got around to repairing my old HP8551 spectrum analyzer's narrowest IF bandwidth setting and looked at the output of my synthesizer on it. In a nutshell, the DAC/LF356 combination appears to be contributing an unreasonable amount of broad-spectrum noise (definitely not oscillation) to the VCO tuning line. Since this happens after the loop filter and

before the VCO, the loop can't compensate for this noise in any way. A 0.1uF capacitor across the LF356's 10K feedback resistor helps a great deal, but the noise is still excessive ("grass skirts" from -40 dB on down.) This noise is also plainly audible as phase noise when listening for the synthesizer output signal on a UHF receiver.

Now, I have seen oblique references to DAC-based pretuning in the Rohde and Best books, but the only actual circuit diagram I've run across assumes a multiple-varactor VCO -- one diode for pretuning and another for loop control. I'm using a prepackaged single-control VCO module and would prefer not to have to homebrew a dual-control one, although I can do so if it turns out this is really the best way to go. I'm wondering if anyone out there has done this type of thing before or seen it done in practice, and if so, what guidelines you can offer me in terms of summing the two voltages together, irrespective of impedance, with the absolute minimum-possible noise contribution. My next experiment will be to use yet another LF356 as a separate, dedicated summing stage, with a heavy filter on the output of the DAC, but I don't really expect that to work much better than what I'm already doing with a single op-amp (above). Not having much experience with op-amp noise performance, it seems that op-amps (I've tried several) just tend to get noisy when you run them near unity gain. Is there a "right" way to do this, one that I just haven't thought of yet?

Please reply via the NG, so that the next fool who tries this can find your valuable advice in DejaNews... :-)

# 2694. Re: 602 as oscillator

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-17 00:00:00 UTC
From: k1bqt@aol.com
Message-ID: <19970917223700.SAA28892@ladder02.news.aol.com>
Source record: 90875

Hi Tim--

You are right, I believe--there would be no point in using the NE602 for its oscillator alone. If you are building a mixed oscillator (such as a heterodyne VFO), then it has value. If you want to vary one LO input level and make a heterodyne oscillator with linear attenuation, then it might have value. But, to use the LO buffer in the Gilbert cell as a oscillator by itself makes no sense to me at all.

73--

Hello!
I'm trying to find a describtion for a
home-brew doppler RDF for VHF.
The reciever is, as I understand just an ordinary one.
The antennas I've figured out too, but I havn't found any
complete schematic for the actual direction finding part.

I live by the coast, and I'd like to see in wich direction
the ships are. (174 MHz)

The VHF/UHF gear that has wide band RECEIVE capability may be
outlawed under this proposed legislation. Most current amateur gear for
2M and 440 have the ability to receive outside the ham bands, which is
frequently a big plus, especially for any ham involved with Civil
Defense/Emergency Management.
I recently used my ability to receive out of band to track a signal
which was interfering with my fire departments emergency communications.
I don't want this legislation to pass.
I would also like to mention that many police officers and
firefighters, myself included, rely on scanners in emergencies because
our departments cannot afford radios for everyone. You might consider
working against this legislation as a means of supporting your local
police and fire departments, unless your municipality is extremely
wealthy and can afford radios for every emergency worker.

Erv,
one of the best things to do is this:
Fax a copy of the bill to every news agency in your city. Fax to every TV station, Radio Station and newspaper. this bill in its current form would also limit said news agencies from gathering information "LIVE" or using said information gathered as part of a breaking news story. This goes a lot further than just amateur radio.

I also suggest that any of the rest of you that have fax machines (or faxmodems and software) do the same. the more people KNOW about this, the less likely that the bill will pass.

That is EXACTLY what the previous writer was complaining about ...
they want to eliminate all reception of "commercial mobile radio
services" ... and outlaw radios capable of receiving them ...

Try checking out the proposed bill ... it really IS quite onerous ...

:203-894-1705....Thanks LOU

I believe Surplus Sales of Nebraska has new boxed units at comparable price, if you are wary of sending M.O. or cash first to an unknown. I think they take credit cards, etc.

I would pay less to a private party since the risk is so much greater.

Ed

ps. also Mike Foreman (sp?) in Oakland, Ca has sold used 8877's for $250 or less. Bought mine there and its worked well for years. was broadcast pull.

# 2703. Re: 602 as oscillator

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-17 00:00:00 UTC
From: Michael Black <blackm00@CAM.ORG>
Message-ID: <Pine.GSO.3.94.970917024610.10837A-100000@Ocean.CAM.ORG>
Source record: 90956

I thought the original question was about using the NE602 when an
oscillator was needed, at times when a mixer was not needed.

If that's the question, it rests on how much that you are saving by
using the NE602. I just gave a quick check, and I don't happen to
have an internal diagram of the IC handy. I thought the internal
oscillator was nothing more than a transistor that had been properly
biased. I don't believe it is anything in the way of a fancy oscillator.
The design is not such that you simply need to add a coil and turning
capacitor; you do still need to add some feedback capacitors.

If my memory is correct, then all that you are gaining by using the
oscillator of the NE602 is doing away with 3 or 4 resistors and a
transistor. Is that worth the higher price? If you gather together
some resistors and a transistor, it will cost virtually nothing, and
you have greater control over the design of the oscillator.

It may be significant that a lot of designs that use the NE602
do use an external oscillator, presumably for the reasons Rick mentions
below. If peoplw bother with an external oscillator when using the IC
as a mixer, surely it is an answer about whether to use the "oscillator"
part of the NE602 without the mixer.

The important thing is to run a two-tone intermodulation test, if you
plan to use SSB. As you increase grid bias you move farther into class C
and harmonic levels get worse.

I once collected and cataloged shareware available on the
Internet and came up with a compressed (zip) collection of
programs and information in about 25 or so categories.

Below are listed directories in which this material was divided,
each containing about 1Mb (compressed) of materials.

Being compressed (zip) this is a substantial collection and it
is now available all in one place.

You should be able to access this through your web browser and
I have included a link on my home page (near the bottom):
http://www.qsl.net/k7on/index.htm

Hopefully, there is something of use to about everyone in there.

# 2708. Crystal osc question

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-17 00:00:00 UTC
From: af389@lafn.ORG
Message-ID: <341FE9A7.6C4F@lafn.org>
Source record: 90961

I am repairing my HAM Shack's DSI Frequency Counter that uses an
MM5639 Color Burst to 60 HZ IC for the timebase. The crystal is
held at a hot constant temperature by means of a pair of resistors and a
Temperature Controller IC.

The Color Burst crystal is not oscillating.
The crystal circuit is:
One side of crstal has a 22 pf COG and a ( est 3-10 pf)
parallel trimmer cap to ground. The other side has another 22 pf COG
to ground. A 5.6 meg resistor shunts crystal terminals.

Only way I could make circuit osc at correct Color Burst Frequency
was to remove the 22 pf cap in parallel with trimmer.
Now timebase is on correct freq but has small cap (only trimmer) on one
side
to ground and larger 22pf on other side to ground.

Now smaller trimmer cap changes make huge frequency difference,
lost easy setability feel.

Should this crystal be operated with nearly balanced capacity
to ground on each side? Should I reduce the 22 pf COG on side
without trimmer and increase cap in parallel with trimmer?

Any idea what happen to cause this situation?
Is crystal aging or defective?

Thanka for your thoughts.

# 2709. Constant amplitude circuit

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-17 00:00:00 UTC
From: af389@lafn.ORG
Message-ID: <341FE324.3110@lafn.org>
Source record: 90962

Hi,

I am thinking of building a sweep generator for HAM Shack test gear
using a DDS Analog Devices AD9850 (1-50mhz) or MAXIM 038 (1-20mhz).

I believe the AD9850 output amplitude is not constant with frequency
and drops fast as the frequency out approaches 1/2 clock frequency (125
mhz).

What circuits are available to make the sweeper output amplitude
constant voltage when loaded with a 50 ohm or constant impedance load
from 1 - 50 mhz as a start?

Has anyone used the MAXIM 038 IC as a signal generator in
the sweep mode? Is it's output voltage constant amplitude?
While the 038 has smaller frequency range than the 9850, it
also does not need a dedicated controller to program.

Thanks for any help and pointers.

73, W6MIK

# 2718. Two Triodes on one HV power supply

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-18 00:00:00 UTC
From: carsten.esch@olympus-software.com
Message-ID: <874588115.21248@dejanews.com>
Source record: 90888

Hi,
I am planning to build a new HF amp with the 8877. I do have a 2m amp with this tube.
My question is: Can I connect the plate voltage from my HV power supply on both tubes, so that I only have to switch the other voltages? That would mean that in one amp only high voltage would be on the plate (without heating etc). Any problem for a Triode to only have anode voltage applied?
Thank you for your help,

Carsten, DL6LAU

Please reply also to my e-mail adress, I am not checking this newsgroup too regulary.

I wonder how often this is a real problem. Many mixers are driven hard
enough to replace the harmonics even if they were filtered off. A good
diode doubly balanced mixer is a good example. Are there any high
performance mixers now in use which don't have this property? The
Gilbert cell is driven from saturation to saturation also.

Bob

I don't see any reason for the output of the 9850 to drop as you
approach 50MHz except for the response of the low pass filter required
to suppress images. A simple AGC amp can be made using a MiniCkts MAR
and controlling the gain with a transistor attached through a choke to
the input of the MAR. When the transistor turns on it lowers the bias
and hence, the gain of the MAR. This also makes a pretty good pulse
modulator for very high frequencies.

## 2724. Re: Dealing with spam

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-18 00:00:00 UTC
From: w1_k_sorter@qsl.net
Message-ID: <5vrhv2$32d@news2.tds.net>
Source record: 90894

Dave is absolutely correct! We need laws and Congressional Intervention to outlaw or atleast limit spam.

If a user wishes to be on the no-spam list, then they should be able to register at a central database, which spammers and mass mailers should be required to check BEFORE mailing spam.

Any UNSOLICITED COMM'L email is SPAM. FUK the spammers and the mass spamming domains.

I've heard of a European group who is going on the offensive against spam, using active hacking techniques and attacking the spammers computers via the network. If that doesn't work, they attack the spammers ISP and so on and so on, till the spammer is forced to change domain names and find another ISP in order to continue.

This sounds GREAT to me!!! An anti-spam terrorist network!

Perhaps someone could write some code that could run in the background when we are connected to the internet-this app would attack spamers via the network-distribute anti-spamming attack software with EVERY MAILER AND EVERY INTERNET softeware packeage, and the spam would stop in short order!

The good thing about attacking spammaers computer systems via the network is that the attacker can send a few bytes, which ties up the computer under attack for several seconds (UDP type). The computer under attack might not respond, but it will attempt to process the input, which slows down the spammers computer. IF EVERYONE was attacking the spammers computer, round the clock from all over the world, it would have little time to mail spam! Again, if attacks dont shut the spammer down, then we attack the spammers internet access computer, and then that isp's computer and so on and so on! Soon, we will be attacking NSF and Gov't computers (maybe).

Surely, once the interent was brought to a standstill with anti-spam tactics, then there would be some legislative action and spam relief from big brother!

GL everyone, and may the professional spammers ROT IN HELL.

Dangerous? You bet I am. But, I live in the country and do not have a local ISP, so I pay long distance rates to download spam. Perhaps you can understand WHY I am so dedicated to getting the spam OUT of the internet.

Please suport antispam legislation and use your real email address.
The answer is NOT for us to hide, we arent the ones who are doing
wrong!

Yes, but the transformers in the DBM only have to pass sine waves
if you use sine wave drive. It is difficult getting a square wave
through a transformer in one piece. Also, your square wave must
have exactly 50% duty cycle, to avoid intermod degradation. How
do you assure that? With a sine wave, it is trivial to get
exactly 50% duty cycle (just filter out all harmonics).

## 2729. Before I try it...

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-18 00:00:00 UTC
From: Tim <Hynde@flash.net>
Message-ID: <3421989D.5F66@flash.net>
Source record: 90899

Before I go to the effort I'd like a sanity check. I was thinking of noise cancelling circuit that goes something like this:

Take the 1st IF and split it in to two circuits, one goes on to the bfo and is detected as usual, the other goes to a bfo with a 10KHz spread and is also detected. The audio from both are fed to a comparitor and then amplified.

The idea being with 10Khz you could move away from the received to and 'empty' freq. but be close enough to pick up the same atmospheric noise and static crashes. Does this idea have any merit or do the commercial rigs already implement a similar technique?

Hi Chris,

Can't help with the flame detector, although I have read about it
somewhere.
Try libaries, for a good biography. Incidentally, Dr. Lee DeForest's
name is
as spelled here, not "de Forrest".

>
Gee! I don't think so, the square wave is just the fundamental and a bunch of odd harmonics. Those little tiny transformers have more trouble passing low frequencies than high. My square waves do right well through them but then I don't operate above 432 MHz either.

For 50-50 duty cycle, I like to use 2x frequency driving a J-K flip flop. That's gorgeous. When you can't afford the 2x frequency, I just bias the inputs to a 74AC540 to 1/2 Vcc with a pot, and drive all sections in parallel. It'll make +23 dBM, pretty square, with 5 volts without a whimper. You just listen to the Intermod of 2 test signals and adjust the pot for minimum. Quite sharp, easily defined and it stays put. If you're not into tri-state, a 74AC04 all paralleled up does the same thing.

For the DMOS mixers, same as above except for biasing the square wave with a little DC and adjusting the DC bias for minimum feedthru at the IF of the input signal. Coincides with best Ip3 and stays put too.

From: Tim <Hynde@flash.net>
Message-ID: <34219B8C.62C3@flash.net>
Source record: 90904

I have a handfull coils from TV's, these are the ones on a plastic form with an iron slug down the center. One has #18 or #20 gauge wire. Would this make a good RF choke for mobile applications? It appears to have 40 to 60 windings around a 1/4" slug.

From: Alexm <alexm@nyct.net>
Message-ID: <EGpxo8.8Iu@nonexistent.com>
Source record: 90905

We're setting up a small FM stereo station (20-100 watts)in the mountains of rural Colorado. We're starting from scratch, so we'll need everything from transmitter to mixer to antenna.

We're electronics neophytes, and though we're willing to learn and study, we'd like to purchase a system that's as close to plug-and-play as possible. Can anyone recommend a plug-and-play FM stereo transmitter system, or can we purchase an already assembled kit from you or someone you know? (We've checked out a Ramsey system which allegedly includes everything. But at 1 watt, it seems a bit underpowered. We've also looked at 12 and 45-100 watt systems sold by R. Scott Communications in Canada. Any experience with their stuff?)

Any help would be appreciated!

I'm not sure I understand the exact topology you're talking about (which
is always hard without schematics and a while to study them) but let me
throw out an idea or two.

In article <34203C27.7C2C@pop.removethistomailme.net>,
jmiles@pop.removethistomailme.net says...

stuff deleted....

Interesting that you'd want a sub-millisecond step. This is rather
fast. I've done some pretty sophisticated systems that didn't need to
step anywhere near this fast. This is a home project?

>

Even more deleted....

>for the synthesizer output signal on a UHF receiver.

Is the noise inside the loop bandwidth? If so, I'm guessing it might be
the DDS itself. One of the more obscure laws of nature is "Thou shalt
not multiply a DDS". When you do so, you get multiplication of the
approximation errors, both amplitude and phase truncation. This turns

into spurs, but they can be so dense that they appear to be broad band noise. Using the DDS as a reference is multiplying it by the loop multiplication factor, N.

The amplitude truncation spurs come from the DAC errors, and the phase truncation spurs come from the sine generation itself. Whether you use look up table or algorithm, the approximation of the number to the real value results in these spurs. AM spurs are multiplied by 10 log N, and PM spurs by 20 log N. This is 24 and 48 dB respectively. If your DDS has a noise floor of -70 dBc (I recall this as a reasonable figure of merit), that would put the apparent broadband noise at -22 dBc, which is pretty horrible. Even if the floor was -90 dBc, that's still an output noise floor of -42 dBc, and that's still pretty bad.

Count me among the "Great unwashed masses" who have never pre-steered a VCO with a DAC. So I can't help much here. But the loop topology scares me, I'm afraid.

Hope this helps/offers some insight....

Hey,
I've got a Sony CD player AM/FM radio and I get rotten FM reception.
There are no external FM (or AM) screws for me to hook in an external
antenna. I was going to put the cable from the cable TV into the antenna
jacks...but there aren't any means of connecting it to the radio.
Can I solder leads onto the telescoping antenna then attach the Cable TV
/FM reception cable to those wires?
Is the telescoping antenna for FM . . .or AM??

Thanks

**********

Better stick with the telephone, Sage. Any conversation transmitted by
radio can and will be listened to. And any illegal operation of a radio
transmitter will, eventually, get you in trouble.

>to outlaw or atleast limit spam.

We don't need any more government regulation at all. It is not possible to legislate civilized behavior.

>The good thing about attacking spammaers computer systems...

There is nothing good about attacking anybody's computer system. There are already laws against this. Who is going to decide how you may use your computer and when you should be attacked? Me? Spammers? Big brother?

Economics should drive the spammer away. Eventually all of the dimwits in the world will discover that it really doesn't work and is not worth the hassles that spammers already run into. The spam servers will not be connected to the net (economic reasons again).

Do all you can to make spammers miserable. Do not damage their property in the process.

The quotes above are very brief, but I do not see that they out of context nor misleading.

Bill

Dont bother with the cable from cable TV, there are thousands of
frequencys on that line and will more than likely provide you with more
noise and interferance. Get a test clip and connect 50ft or so of wire.
That should improve things. If you want a more elaborate FM antenna,
email me. Put the wire outside if you can for enhanced J. Geils
reception.

Interesting. I found that when using 3.58 MHz ceramic resonator VXOs,
there is sometimes a discontinuity in the tuning range. I read an
article saying that this could be overcome by having two ceramic
resonators in parallel, with no effect on the pulling range. Ordering
two crystals is a bit costly, but two ceramic resonators are cheap :)

# 2753. Various modes from I & Q

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-19 00:00:00 UTC
From: Joseph M Zawodny <J.M.nospam.Zawodny@LaRC.NASA.gov>
Message-ID: <3422A4AF.7FA5@LaRC.NASA.gov>
Source record: 90825

Hi,

Does someone have a decent, obtainable reference on the
subject of gennerating the various modes (USB, LSB, FM) from
the I & Q inputs(outputs) to a quadrature (de)modulator? Or
better yet, can some one post it? Like I=Q is USB, I=-Q is LSB
or whatever is really correct. I do not feel like doing the math
myself - I have a hamfest to go to this weekend :-).

Thanks in advance,

KO4LW

> Is the telescoping antenna for FM . . .or AM??

The telescoping antenna is for FM. There are a couple of ways to couple to this. The simplest way is to loosely wrap a few turns of insulated wire around the rod and solder the ends of the wire to the inner and outer conductors of the cable. A more sophisticated method is to use a L network between the cable and the rod/chassis. The easy method will probably suffice, however.

I am having trouble with high ripple current (10%) from a Pyramid PS-14k.
I would like a copy of the schematic for this power supply. Thoughts or
suggestions appreciated.

Gee, I think it's off the air and if you are getting it to come up it is probably already in your system. I'll bet if you reload you'll see the DNS flag.

We've tried quite a few times here.

>Tim, ka8ddz

The two signals won't be phase coherent, so they won't cancel. You can
use the second channel to derive a switching signal for a noise blanker
in the main channel, however. That may be what you mean with the
comparator reference, but you really want the blanker much earlier
in the radio, before the narrow IF filtering, and not down at audio.

This is an old technique, and has been used in many radios, though the
spacing is usually much greater. The problem with such a small separation
is that you're still in-band, and likely to have a signal active on the other
channel. That's not good. You want the noise channel to be in a fairly
inactive part of the spectrum.

>Any suggestions would be appreciated!

You could just do that, John, but the better method is to use a codec like the phone company does. These are available as single chips, and aren't expensive. A codec does more than just A/D. It usually has some type of compression and conditioning, and serializes the data according to a supplied clock signal. This works well with the 56 kb RF modem because it supplies clock and expects synchronous input. The codec also reverses the process on the other end. Since 56 kb is a standard telco rate, this makes a perfect fit.

Peter: Thanks for the info. These guys are talking about 50 Khz
frequency shifts! I'd gladly buy another crystal to go that far!

I'm surprised by how little reaction my posting caused. I can only
hope that experimenters around the world are hard at work over hot
soldering irons, trying out this new technique from the east! I
really kind of expected a lot of "Oh we've been doing that for years"
messages!

This would be a very useful development for the QRP/Homebrew
community.

A few updates have been made to the Australian QRP Home Page. These include a revised diary section, information on the latest Lo-Key, and the odd new link or two (will be of particular interest if you're into VXOs).

In addition to the new material, the page has information on building/buying equipment, explains the ten steps to QRP success and has many links to similar pages around the world.

You can get to the page by clicking on the URL below.

Better be CAREFUL that you also connect a GROUND RETURN HT- lead to
both amps!!! Otherwise your amp chassis could be sitting at HT+
(that's B+ for the Yanks) and give you a nasty shock!

Your answer is VERY misleading here!
Micro-broadcasting is done LEGALLY in many cases.

There is provision for folks to transmit at 100mW into a five foot
antenna legally - and in the broadcast bands. RAMSEY ELECTRONICS and
SEVERAL other manufacturers sell a variety of transmitters for this
purpose. Everyone knows Radio Shack and other toy companies sell
"wireless microphones" and "wireless intercoms" etc. etc. that all use
100 mW or so on the medium wave, as well as 49 MHz, VHF-FM broadcast
bands etc. etc. and they are NOT illegal to use!!

You can broadcast JUST LIKE a regular FM station if you want, and ON
the FM band with a 100 mW stereo quality station. You can spend
anything from $30-3000 on such a station.

For more details and FACTS (instead of opinions) see:

http://www.mnsinc.com/bry/piralynx.htm

Found that list a bit overwhelming due to heavy volume PLUS they
charge $12 or $15 a year ... for WHAT?

All other lists are free, so I encourage folks to try them first!
However, I should include the JACKATTACK boatanchors group with a
caveat I suppose.

I have links to their ARCHIVES on my links section. I find THAT more
useful.

If I want to reply to the whole group I can get the list and do that
too!

Thanks for your helpful comment though, and I will add that list.

I'll stick by my first statement (Its a matter of field strength). If you stay legal you'll be lucky to hear your own signal at the end of your house...not Mw but generated strength. I've played this game before and 100 Mw into a 5 foot antenna will be heard for at least 1 block. Play at your own risk...73

>>We need laws and Congressional Intervention
> >to outlaw or atleast limit spam.
>We don't need any more government regulation at all. It is not possible
>to legislate civilized behavior.

While I don't always agree with that statement, in this case I do.
Mainly because if we outlaw spamming from U.S. sites, what's to keep
them from moving offshore? Further, many spammers are already
promoting products that are contrary to law; what makes one think
they'll obey anti-spam laws? I certainly wouldn't mind seeing the
Nashville Police haul a few spammers off to jail -- but I'd rather see
them haul off a few armed robbers/murderers/etc..

> >The good thing about attacking spammaers computer systems...

>There is nothing good about attacking anybody's computer system. There
>are already laws against this. Who is going to decide how you may use
>your computer and when you should be attacked? Me? Spammers? Big
>brother?

I'm of mixed mind on that. I have no sympathy for spammers or those
who harbor them (or their other customers) when they get shut down by
revenge attacks. But without an organized definition, we run the risk
of a million different people with their own definitions of
unacceptable behavior shutting down legitimate systems.

>Economics should drive the spammer away. Eventually all of the dimwits
>in the world will discover that it really doesn't work and is not worth
>the hassles that spammers already run into. The spam servers will not be
>connected to the net (economic reasons again).

Won't work. Spamming is so incredibly cheap that if they make only
one sale per thousand spams, they're going to be ahead financially.
Kinda like bulk postal mail. 99.9% of it gets thrown out, but if 0.1%
buy... This is especially true since most spam consists of products
of questionable legality that can't get advertising space in
legitimate media. (or items that are out-and-out illegal...)

IMHO the way to stop it is to make it economically impossible for ISPs
to harbor spammers. Allow them to deny service to domains that
transmit spam -- and allow them to refuse connections to other ISPs
that allow their clients to send spam. At the same time, the
government can help by ensuring ISPs won't face lawsuits or antitrust
problems by cutting spammers off.

>Do all you can to make spammers miserable. Do not damage their property
>in the process.

While I don't condone anti-spammers damaging other people's property,
it becomes awfully tempting when the spammers are *stealing* my
property (time, hard-drive space, connect time, long-distance time) to
transmit their material against my will. I won't sabotage them -- but
I won't feel sorry for them if someone else does.

Here are some excerpts from the FCC Part 15 rules on low-power communications devices. See the Longwave Home Page at http://members.aol.com/lwcanews/index.html and follow the links to "Part 15 Experimental Operation" for more information. There are no restrictions that prevent using such devices for "micro-broadcasting" in the 510 to 1705 kHz range as long as there is no interference to licensed radio services.

I want to emphasize, however, that 100 milliwatts is *not* legal in the FM band.

15.23 Home-built devices.

(a) Equipment authorization is not required for devices that are not marketed, are not constructed from a kit, and are built in quantities of five or less for personal use.

15.217 Operation in the band 160-190 kHz.

(a) The total input power to the final radio frequency stage (exclusive of filament or heater power) shall not exceed one watt.

(b) The total length of the transmission line, antenna, and ground lead (if used) shall not exceed 15 meters.

(c) All emissions below 160 kHz or above 190 kHz shall be attenuated at least 20 dB below the level of the unmodulated carrier. Determination of compliance with the 20 dB attenuation specification may be based on measurements at the intentional radiator's antenna output terminal unless the intentional radiator uses a permanently attached antenna, in which case compliance shall be demonstrated by measuring the radiated emissions.

15.218 Operation in the band 510-1705 kHz.

(a) The total input power to the final radio frequency stage (exclusive of filament or heater power) shall not exceed 100 milliwatts.

(b) The total length of the transmission line, antenna and ground lead (if used) shall not exceed 3 meters.

(c) All emissions below 510 kHz or above 1705 kHz shall be attenuated at least 20 dB below the level of the unmodulated carrier. Determination of compliance with the 20 dB attenuation specification may be based on measurements at the intentional radiator's antenna output terminal unless the intentional radiator uses a permanently attached antenna, in which case compliance shall be demonstrated by measuring the radiated

emissions.

Also be sure you have the two chassis connected together and then
connected to your AC line ground. Most recent designs for high power
HF amplifiers have both the B- and B+ "floating" with respect to
chassis ground. This could pose a problem if there were an arc to the
chassis in either unit. Having both chassis connected together and
also to AC-line ground ensures that HV can not appear on the chassis.

N8XYN,
I don't understand what you're saying here, but Bry _is_ correct.
The old RS 12-in-1 kit had a 1 tube xmitr. The instructions for that
experiment included the CFR47 regs on the circuit (Probably required by law).

Ya' know...a 1/2 wave dipole for 100MHz(Commerial FM) is under 5' in length.
Ask a QRP guy the best way to feed 100mW to a dipole, but I'll bet the
range is in _kilometers_, not rooms or blocks. I've done 5 miles on 2m@500mW.

That may work fine and dandy, unless Tim lives in a deep valley.
Usually you can make the cable hook-up (or an external antenna hook-up
for that matter) work by splicing the center conductor of the coax (a
clip lead works well) to the antenna and connecting the shield to one
of the screws on the back of the box that connects to the chassis of
the radio. It's actually kind of close to 75 ohms usually! Good
luck.

Hmmm very interesting... but how does it work? 2 xtal's can't be exactly the same... Does this circuit force both xtals to resonate together? Change the Q? What happens if you put a third, fourth, fifth xtal? Do you get a wider swing than with two? How about FT243 types? What if one xtal was 10.14 and the other was 10.15?

hmmm a small handful of parts and a RF freq counter could keep me busy for a few afternoons....

> Bob, KE6F
I wonder if there is any point in making such a device. You can get
amplitude information with a demodulator probe and a narrow-band scope.

The down converter does allow some frequency information but most modulation will be produce such small deviations that I doubt you could tell much even after the down conversion unless the local oscillator of the converter were good and were tuned rather close to the frequency of the signal to be studied. (but this is hardly a substitute for a fast scope- it is doing a job the fast scope is not able to do except with the same downconverter and a slower sweep.)

Bob

1/4 wave Ground Plane

This is a very well built Antenna.

3/8" Solid Aluminum Vertical Element
gives very Wide Bandwidth (over 3 MHz)
2 Meter is over 12 MHz.

Four 1/4" Solid Aluminum Radials.
Angled for Minimum VSWR & low angle Radiation.

SO239 Connector & Stainless Hardware
for mounting on a mast up to 1 1/2".

This is a Limited Time Offer - 9/30/97

E-Mail me your UPS Address
I will ship the antenna with an invoice for
$20. + $5 Shipping (Total $25.)
Put it up, check it out.
If you don't like the antenna for any reason.
Just put it back in the box, send it back,
and owe nothing.

I am betting you will find this to be a quality product,
well worth the money and will send a personal check
for the $25.

Can I Build one for You ?

The possibility also exsists that he disapproves of the auction process
and this is an effort to disrupt that process. If he takes equipment
and doesn't pay for it that is another matter. As it stands it looks
more like a protest effort to me.

CatScan provides computer control for the Yaesu FT890 (and similar)
transceivers. It complements the facilities found on the radio, and adapts
the radio better to a radio facsimile monitoring environment.

*** It provides a simple way to use a Station database, and to browse the
bands selectively.

*** It has Advanced scanning facilities, to help you find the best signal on
the bands.

*** It has Short-cuts to otherwise awkward functions, such as Direct
frequency key-in, Write memories to radio and Side-band/filter toggle.

*** It has a Command line interface so that scripts can be used to control
the radio from within other programs.

It is free, and available for downloading at:
http://www.geocities.com/SiliconValley/2504/catscan.htm

73's from Brian.

Hi, Bob --

>
> Interesting that you'd want a sub-millisecond step. This is rather
> fast. I've done some pretty sophisticated systems that didn't need to
> step anywhere near this fast. This is a home project?

Yes, the idea being that it should be able to scan a range of several
hundred channels/second while a second receiver is monitoring one.

The low loop modulus (256) and high reference frequency range (3-5 MHz),
combined with a switchable-time-constant loop filter, makes it trivial
to achieve the switching-time goal. That part is already working,
albeith noisily. :-) There is no reason on earth why this shouldn't be
an exceptionally clean loop -- certainly reference sidebands are not a
problem. <g>

>
> Is the noise inside the loop bandwidth? If so, I'm guessing it might
> be the DDS itself....

The noise is definitely outside the loop bandwidth. It is independent
of whether the "fast" or "slow" loop filter is switched in. It does not
change when a 3.58 MHz crystal oscillator is substituted for the DDS.
In fact, it's still present with the loop open and a clean, filtered
2.5V DC source substituted for the loop filter output. It is
absolutely, unquestionably, coming from the DAC/op-amp combination.

The noise is *not* present with a filtered DC source driving the VCO
tuning line directly, without the DAC/op-amp.

> Count me among the "Great unwashed masses" who have never pre-steered
> a VCO with a DAC. So I can't help much here. But the loop topology
> scares me, I'm afraid.

The architecture sounds a lot more complicated and "scary" than it is,
but is actually pretty bulletproof. The whole thing is controlled via a
PC parallel port, and the sequencing looks like:

(frequency change request occurs)
- Switch loop filter to "fast, dirty" mode
(high bandwidth, low RC time constant)
- Look up output frequency and program DAC to
steer the VCO to the closest intermediate point
(within 2-3 MHz)
- Program DDS chip for required reference frequency

(=output in MHz / 256) -- takes about 350 uS
- Wait ~500 uS for frequency lock
- Switch loop filter to "slow, clean" mode
(BW = a few hundred Hz at most to clean up
multiplied DDS noise)
(frequency change request complete, elapsed time < 1 ms)

This business about getting a clean voltage sum has been the only real hangup I've experienced on the project, but it's a nasty one. I am far from knowledgeable when it comes to the noise performance of op-amps and such, which is why I'm very tempted to dodge the problem altogether with a dual-varactor VCO.

thanks -- jm

>anything from $30-3000 on such a station.

This is SERIOUSLY WRONG. The relevant paragraphs, last I looked,
were 47 CFR 15.219 and 47 CFR 15.239. The Code of Federal regulations
is at http://www.access.gpo.gov/nara/cfr/index.html if you want to check.

First a minor quibble, AM broadcast band allows 100 milliwatts input
power with a 3 meter (10 foot) antenna/ground system.

FM broadcast band is severely restricted to a field strength of of
250 microvolts per meter at a distance of 3 meters. You plug this
into various antenna equations and you get a radidiated power of
around 30 NANOWATTS with an omni directional antenna. Enough to
get you about 100 feet.

>

It certainly is. I did some experiments with four crystals and the VXO circuit on the 7N3 station's homebrew home page (see my QRP page for the URL).

The worst increase in shift I got was 44%, while the best that I got was close to 200%. And, I didn't attempt to optimise the component values - the experiment was just to prove that using two crystals in parallel really works. Sometimes the increased range was at the top end, but at other times it was near the bottom. I found that the percentage increase in pulling range is the highest when a sizeable series inductor is being used in the crystal circuit.

Even the small (non HC/6) type that are not recommended for VXOs showed some improvement. The best change I got was with 7.159 MHz xtals whose range increased from 9 kHz to 27 kHz when I added the second xtal.

From my own experience, pulling ranges of 25-40 kHz should be possible on 40 metres, and correspondingly higher on the other bands. Certainly a little VXO DSB rig on 10 metres would be a fun project - a 100 or 150 kHz pulling range (say 28.350-28.500 MHz) should be sufficient.

Chris,

Go find a heating system specialist that sells ionisation detectors which are used as flame fail devices on furnaces and boilers. You will find all about the way that flames rectify from the manuals which they will have about the devices.

I used them a lot for this purpose many years ago.

PWM cannot be used with these old transmitters, Bob. Without sophisticated Envelope Elimination and Restoration techniques and DC coupling of the modulator, you would wind up transmitting an unwanted sideband and a useless, annoying carrier. You would likely wind up with a conventional AM signal which, as you know, would be a selfish use of amateur spectrum space.

I find it worth the $12/year for the BoatAnchors subscription because this
group has almost zero spam and has zero off-topic political pollution.
The signal-to-noise ratio is very high, and if you are interested in
tube-based communications or test equipment, I recommend you ask for
the free trial period. WPE9CGQ

Source record: 90791

Hi Barry--

Several home-builders in the QRP catagory have been successful using the NE602 as a balanced modulator. The MFJ SSB radios, and possibly some other kits, also use the NE602 for a balanced modulator. From my own experience, it's difficult to get really good carrier surpression driving the NE602 with its internal oscillator. However, when driven from a seperate LO source, very deep surpression is possible. In a transceiver, this means stealing LO from the receiver BFO. Don't know about using ceramic resonantors with the NE602--haven't tried it.

Clearing out the shack. Everything works unless otherwise noted. I don't have documentation for most items (sorry).

-- Heathkit HM-102 2kw HF power and swr meter. $30.00
-- Heathkit HM-2102 vhf/uhf power and swr meter (untested). $25.00
-- Heathkit SB-600 speaker. Matches the SB line. Looks great. $45.00
-- Heathkit IM-25 laboratory all solid state VOM. This is the one with the huge 6" analog meter. $45.00. Could use a paint job. Heath used that rubbery type paint.
-- Heathkit HM-2140 2kw HF swr and power meter. Needs work. Cosmetically looks real good. No scats with this. Has potential as a parts unit or fixer-upper. $25.00
-- Heathkit IG-102 sig gen. Looks fair. $35.00
-- Heathkit electronic eye signal chaser. Model T-4. $30.00
-- Heathkit sig gen model SG-8. $25.00
-- Heathkit o'scope calibrator. No model number. Untested. Mid 70's era. $20.00
-- Heathkit o'scope. Very old but very, very good condx. Model IO-12. $40.00
-- Eico model 377 audio generator. Looks fair. $30.00
-- Philco sig gen model 7200. $30.00
-- Textronix model 317 oscope. Timebase goes down to .2uS or .04uS expanded. A very neat, little o'scope. $75.00
-- Heathkit IM-18 VTVM. $30.00

If you want EVERYTHING listed I will cut you a huge percentage off of the individual prices.

## 2822. Motorola MPN3401

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-21 00:00:00 UTC
From: johnsonhe@aol.com

Source record: 90794

Anyone with an old Mot data book? Looking for data on the 3401. Obviously obsolete, all I can find is the 3404, VHF switcher. Need carrier lifetime of the 3401. I have exonerated them as a source of Intermod to the -33 dBM level on 20 meters, (Ip3 of +21) but my homebrew test equipment doesn't extend to 160!

Used in Cubic 102, 103 series as signal switchers and BPF switches.

Tnx if you can help

Well, tnx anyway.

# 2823. Please help identify a Component

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-21 00:00:00 UTC
From: Kin <kng@pacbell.net>
Message-ID: <01bcc663$60005df0$6401aace@kinsnt>
Source record: 90795

I am hoping if someone can help me identify this component for my Sony TV.

The TV's Model is KV-27EXR25, the component number is THP601.

The component is rectangular and looks like a regular relay. But it's only got 3 legs and is enclosed in a black plastic case. 2 of the legs connects directly to the 2 incoming power leads. The manufacture is TDK. There are 2 sets of numbers printed on top. They are:
081-23
1N02

My TV's symptom is that there is no sound and no picture. I traced the power all the way to this component. This component is very hot to the touch. But it's enclosed in a plastic case and there is no heat sink attached to it. So I think this component may be the culprit.

If anyone can help me with any info on where I can get the schematic for my TV, or where can I get the replacement component, or help me identify what it is, I'll appreciate greatly. Thanks in advance.

Kin

(I believe the MMBV3401 is still current...and appears to be just in a
different package.)

The MPN3401 data sheet says "...designed primarily for VHF bandswitching
applications..." It's strangely quiet about carrier lifetime. Guess you
could do a
test with a pulse with fast rise/fall times and a scope?

From title 47 of the Code of Federal Regulations, Part 15, subpart C:

Sec. 15.239 Operation in the band 88-108 MHz.

(a) Emissions from the intentional radiator shall be confined within a band 200 kHz wide centered on the operating frequency. The 200 kHz band shall lie wholly within the frequency range of 88-108 MHz.

(b) The field strength of any emissions within the permitted 200 kHz band shall not exceed 250 microvolts/meter at 3 meters. The emission limit in this paragraph is based on measurement instrumentation employing an average detector. The provisions in Sec. 15.35 for limiting peak emissions apply.

(c) The field strength of any emissions radiated on any frequency outside of the specified 200 kHz band shall not exceed the general radiated emission limits in Sec. 15.209.

(d) A custom built telemetry intentional radiator operating in the frequency band 88-108 MHz and used for experimentation by an educational institute need not be certified provided the device complies with the standards in this part and the educational institution notifies the Engineer in Charge of the local FCC office, in writing, in advance of operation, providing the following information:
(1) The dates and places where the device will be operated;
(2) The purpose for which the device will be used;
(3) A description of the device, including the operating frequency, RF power output, and antenna; and,
(4) A statement that the device complies with the technical provisions of this part.

I tried using the 602 internal oscillator as a ceramic resonator VXO with
a DSB rig for 80m. It wasn't really successful. The main problem was
that the output of the transmitter changed drastically as you tuned
across the tuning range.

Using an external one transistor ceramic resonator VXO fixed the problem.

Hi -- I'm trying to repair an old Heath power supply and need some suggestions on transistor/fet substitutions. It appears that someone did try to repair this thing and attempted to use whatever they happened to have in their junk box. No good. The only source for substitutes I could find is from NTE but I expect that I could get buy with more common substitutes that I might find at Radio Shack or elesewhere. I've had no luck trying to find the original parts in the Newark, Mouser, Digikey, etc. catalogues. The original parts that I'm looking for are 2N4304 (fet), 2N3566 and 2N3393. They're used in the regulator circuitry -- I guess before the days of 3 terminal regulators. Any help would be appreciated.

# 2834. Re: Transistor Substitutions

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-21 00:00:00 UTC
From: Michael Black <blackm00@CAM.ORG>
Message-ID: <Pine.GSO.3.94.970921183318.15967A-100000@Stratus.CAM.ORG>
Source record: 90806

I've used semiconductor replacement guides for twenty years, but I don't recall ever buying one of the replacement line products.

If I was looking for a replacement for something that I didn't have on hand, I'd look up the device I was trying to replace in something like the ECG replacement guide (I used to use an HEP guide years ago). From that, you'd get the specs. If it turns out to be fairly general purpose, then pick some transistors that you happen to have on hand, or which are readily available, and see if they happen to translate to the same replacement. If not, you might find the specs are similar enough that you could try the device. If the match isn't exact or good, try something else.

This often does work fine for general purpose devices. It's harder for things used in a more obscure function. I remember looking up quite a few power transistors to come close to even a close match to a horizontal output transistor to simply check if a new transistor would fix the problem.

For instance, I just looked up the 2N3566 and it crosses to an ECG123A. I know that must be a common device since I remember coming up with that ECG number quite a lot when looking up transistors. Picking a common "common" transistor, the 2N3904, I see that it too crosses to the ECG123A.

This may not be a suitable substitute, but then you might find that if you spent the money on the ECG replacement that it too would not work. But chances are that it will.

The MPF102 does not cross to the same device as the 2N4304. The DC characteristics are different, so it's not just a matter of the MPF102 having RF qualities. Whether it would work would depend on how it is used, and the circuit. I would think in a power supply the DC specs would tend to be more crucial than in a preamp.

How is the 2N4304 used in the cicuit? Is it by chance being used as a current source? The gate is connected to the source (or is it the drain?), perhaps with a resistor. I can picture such a circuit being used in a power supply feeding a zener diode instead of a voltage dropping resistor.

Hello All,

I am looking for a 10.700 MHz crystal for testing
the IF stage of a homebrew receiver. Any ideas
where I could find one of these? I'd really like
parallel resonant and an accuracy of a few tens
of ppm, but I'll compromise on those. Obviously,
this being a homebrew project, cost is a concern.

Thanks for any input,

Joe

The newsgroup sci.electronics.repair is a better place to ask this question. Also recommended is the WWW FAQ site for the group at http://www.repairfaq.org . Try reading that first.

>The component is rectangular and looks like a regular relay. But it's only
>got 3 legs and is enclosed in a black plastic case. 2 of the legs connects
>directly to the 2 incoming power leads. The manufacture is TDK.

It's the degaussing coil power control, sometimes called a Posistor. Every time the television is turned on after being off for a while, the magnetic coil that's built in around the front of the picture tube is energized to erase out any residual magnetism that can affect the quality of the colors that are displayed. Inside the component there are 1) a temperature dependent resistor and 2) a heater. When the set is cold, the temperature dependent resistor has a low resistance, and the degaussing coil gets a large current through it. (This is the loud hummming thunk you hear when you turn it on). The temperature dependent resistor then heats up, which causes its resistance to rise, and the current in the coil to decrease, pretty much down to nothing. The heater then keeps the temperature in the component high enough so that the high current doesn't reoccur until the set has been turned off for a while.

See the web site for suggestions on where you can get the servicing information and addresses for parts distributors that specialize in the repair market.

How wide is the bandwidth of the IF that you are testing? Various alternatives to getting a crystal come to mind, but depend on whether you need it on an exact frequency for alignment purposes, or just for testing.

The third harmonic of a color subcarrier crystal will come out about 40KHz high.

I recall a circuit in Elektor magazine from about twenty years ago that used a ceramic filter (not resonator) in an oscillator for use as a 10.7Mhz signal generator. I can't remember what kind of circuit it used.

If you are converting to a second IF of 455KHz, then a 10.240MHz crystal is commonly used to make the conversion to the second IF. If you were to mix that with a 455KHz signal (the BFO, perhaps?), you would get 10.7MHz. Even if you weren't doing a second converstion, you could pick up a 10.240 MHz crystal (found in double converstion CB sets, 49Mhz walkie talkies, and probably other pieces of electronic equipment) and mix it with a 455KHz signal. You might happen to have the latter at hand, or at least it being a common frequency might be easier to get ahold of. Or maybe you can get a 455KHz cerqmic filter (with three terminals, not a two terminal ceramic resonator) out of an AM broadcast receiver and get it to work in an oscillator).

Tapping a 10.7MHz IF signal from an already existing receiver (such as a 2Meter rig or a scanner, make sure the IF is in fact 10.7MHz) might be another possibility.

I'm sure there are other work arounds that will get you the needed signal without the exact crystal.

I have a Heathkit tubetester model 17-21 in not working condition. I am seeking schematics, user and/or service manual, to put it into workable condition. Any help greatly appreciated. Will gladly send sase or ?
As I understand there are many close cousins of this small portable tester, I would welcome even similar model's info. Best Regards to all.......

Howdy from Texas,

Our microstation here in San Marcos
has been up nearly six months. The
only entity trying to shut us down
is the city, and they're not doing
a very good job... their case thrown
out of municipal court (for "operating
a bus. out of a res." the station is
not a bus., entirely non-commercial).

Broadcasting at 35 watts, reaching maybe
five mile radius, can be heard along I-35
between Austin/San Antonio. It is perfectly
legal, mainly because it doesn't bleed on
any lisc. stations. In fact, a new Houston
station had to turn down their power so
they wouldn't bleed us US (we're 105.9 FM).

Invite all to listen live over the net
via Real Audio, station is up 24/7, programming
is extremely diverse in nature.

Hear us at http://www.mediadesign.net

Thanks,
Chris

>
Using a DDS as a reference works pretty well, but you should really
narrow the range of the DDS and use a band-pass to limit the effects
of the spurs generated by the DDS. I have built synthesizers using
this approach with the nominal DDS output at 455KHz. I filtered the
DDS with a couple of ceramic resonators, and got a beatiful reference.
I reccomend trying the National Semi PLLatimum series of PLL chips.
Do course tuning with the "N" and fine tuning with the DDS. This
system works great. With a properly designed loop filter, youy will
have no problem reaching the 1mS settling time you need.

Ah! were talking apples and oranges! US (FCC) reqs wont allow field
strength levels to exceed a certain level. The FM10 with its tiny 10 Mw
output will create too high a field strength with a proper antenna.
What I was saying is that an "UNMODIFIED" FM10 cant be heard for more
than a hundred feet (AND IS LEGAL)...73

> Try using Eudora Pro which includes an excellent, easy-to-use spam
> filter.
<description of filter options snipped for brevity>

Nice features, but these are short-term solutions to the spam problem. I believe spammers will find ways around such filters. The only real solution IMO is to send complaints to the sender's ISP, and if that fails, to THEIR ISP. I encourage you all to send notes of complaint. This is NOT a request to spam the spammers- merely a suggestion that you inform the responsible parties of your displeasure. Of course, if MANY people do this, the end effect is similar, and they'll eventually take the hint.

Here's what I do:

- switch "full headers" on for the offending message. Most email readers allow you to see 'brief' or 'full' headers.

- The 'From:' field is almost always bogus. Look instead at the list of systems through which the message passed. Figure out which ones were involved early on (please study the format of the list carefully, so you don't waste time sending email to irrelevent email hubs). In the list of 'received from ...' statements, it will be the bottom-most.

- Use various utilities to verify which systems are real and which are bogus. Try 'finger', 'whois', 'ping' and 'nslookup' (or your local equivalent programs). If you don't have access to such utils, skip this step.

- Send a complaint to the administrator of that system. I recommend trying to send to 'postmaster@xxxxxxx.yyy' or to'root@xxxxxxxx.yyy'. Alternatively, the 'whois utilities usually give the email addresses of administrative and technical contacts.

A note about the complaint - keep it relatively short and to the point, and avoid offensive words or threatening statements. They may be in a position to do you a favor, if so inclined. I always copy the original message (with *all* header info) into the bottom

Good luck, all.

Bob, KI8AB

of my email, where they can read it if they choose.

Harper College in Palatine, IL will hold their one-day NO CODE Amateur Radio Review Course and Exam on Oct. 18, 1997. If you or someone you know or work with want an easy way to a License, this is it! Start at 08:30 review Radio, one hour lunch break, review Law and Operating Practices, then take the Exam at 16:30. Every subject on the exam is covered, hence if you have any physics or math background or have a radio background this is the "HAM CRAM " course for you.

Total course including pre course notes and exam $20.00.

Call 847-925-6994 for details.

Please copy and post at work and on local northern Illinois BBSs and nets.

Thank you;

# 2854. Cathode Follower Power Amplifiers

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-22 00:00:00 UTC
From: wlfuqu00@pop.UKy.EDU
Message-ID: <199709221743.NAA00833@pop.uky.edu>
Source record: 90728

Has anyone had experience with Common Plate (Cathode Follower)
RF power amplifiers? I would like to operate a 304TL in this
configuration. The idea is to operate the tube in AB1 so that the
only drive power needed it to overcome losses in the grid tank
circuit in generating the 3KV or so peak grid voltage.
The filament will be heated by a home made low capacitance
transformer and the output circuit is to be a PI-L network.
I hope to get about 800 or so watts out with out the drive
requirements of a GG amplifier (almost 200watts for 304TL) and
with out the normal problems of grid driven triode tuned amplifiers.
If it works with this low Mu tube I may try it with the
others I have (3X3000F1) and (3CW5000F1). It be
a very low distortion and low drive power amplifier.

I fuzzily remember such a test as a common lab/homework problem for IC Device Electonics classes.

If you apply a constant forward bias thru the diode, and then abruptly turn it off and measure the decaying voltage, the minority carrier lifetime is a function of that curve in some way. Couldn't find any simple formula in Muller and Kamins "Device Electronics for Int Cir", but it may be in there somewhere.

Maybe the easiest and most definitive solution is to just fwd bias a diode with a signal generator on input and scope or spectrum analyzer at the output. Then see what the lowest freq is for acceptable distortion.

Rob.

Exactly what I did 2 days ago. I'd recommend you give it a go.

I don't know precisely how it works, but works it does with all the crystals I tried. I got between 40 and 200% increase in pulling range when I added the second crystal.

As for more than 2 crystals, I tried adding a third, and the swing was only very marginally (200 Hz) more than with two crystals, and the oscillator had problems in starting.

FT243 crystals aren't much good in VXOs compared to HC6/U crystals. However some of my experiments were with HC18/u crystals (which also aren't very good in VXOs), and I got an extended swing with those as well. I didn't do any tests with crystals on different frequencies.

I have an ic 271 e from icom
I would like to know how to extend the band
Actually it works from 144 to 146 Mhz
Tnx fer every answer

Yea, guess I could. To determine whether it's a problem on 1.8 MHz, I could just duplicate my 40/20 meter capability for Ip3 testing and check that too. That after all is what I'm interested in. Tnx anyway.

Apart from rubber-tybe xtals, old HC6/U large plated overtone xtals
operated on fundamental frequency is best. Unfortunately writers
seldom refer to what type of xtals they have used, so many amateurs
make efforts invain!

I tried another VXO some years ago, a Hartley L/C oscillator with the
xtal connected in paralell to the circuit, a 7022 xtal would cover
more than half 40m band (which is 7-7.1 in this region).
Xtal was HC6/u based surplus type from JAN xtals

> Chris

Chris,
First of all, it's good to see a "short" question.
Second, I believe Leon has the best description, so far. In fact, my understanding is that electrons are EVERYWHERE. Specifically, the molecules that make up air have many free electrons in them.
The flame acts just as the heater in a vacuum tube. It excites the electrons into travelling the distance from the cathode (flame) to the anode (electrode above the flame). The reason you can't get much current flow is because of the free molecules in the air between the flame and the anode. The electrons bump into them and miss the anode. That's why they suck the air out of vacuum tubes.
Speaking of hot air, if anyone disagrees with that description, I will sit humbly by whilst the student learns from one of greater wisdom. I may learn, also.
Radio Randy

>TV.
>
>The TV's Model is KV-27EXR25, the component number is THP601.

It's a thermistor for the automatic degaussing circuit that operates immediately upon power on. When cool, THP601 only measures a few ohms. Within 30 seconds of power on it warms up to several thousand ohms. That reduces the AC current in the degaussing coil to nil.That makes it a positive thermistor. It sounds like it's operating normally.

For a schematic, call Andrews Electronics 1-800-289-0300

You can do a lot of this automatically with a program called SPAM HATER. It is a free program that will compose complaints for you automatically and send them to ALL of the offending addresses contained in the SPAM.

I have been doing this for months. The volume of UCE Spam I get has not diminished ONE BIT during that time.

Once the bastards have your e-mail address, the begin selling it to all the dumb people who think they will be able to sell things to you that you don't want.

Even if a SPAMMER offered me a new car for $1.00 I would not buy it from them just on principle.

I am going to look for some better spam filtering software. There has to be a way to head off this disaster before it destroys the Internet.

We have to get to the root of the problem, which is FOOLISH ISPs that allow irresponsible jerks to send THOUSANDS of bulk-mail messages to people who do not want the garbage.

Bry

Hi,

I want to build a boatanchor CW transmitter. Medium power (25 - 150 watts) maybe an oscillator and a 6DQ6 or a 6146 or a pair of 6L6s or 807s, crystal control, pi-network output, and doesn't need coil forms that I can't get. Nothing too fancy. I've got the power supply iron.

I'm sure there have been plans for many such transmitters but can someone point me to a URL for a good one? Or point me to a book that is still available or to an old QST/73/CQ article?

Thanks in advance!!

In this country you may register in a database that you don't want to
have calls from companies selling goods via telephone. I have
registered, and very few calls of this kind are received, if so, I ask
if they have checked the list, and they might be prosecuted!
The same should apply for internet, at least for this country, hi

Source record: 90668
Cross-posted to: sci.electronics.design,sci.electronics.misc,rec.radio.amateur.homebrew,alt.engineering.electrical

I am sorry if this is a stupid/simple question, but it I guess I just skipped a part of my life.

I was wondering if there are "industry workhorse" P-Channel and P-Channel FETs, like there are NPN and PNP transistors.

You know, like the good old 2N2222, or for power the 2N3055, etc...

I am looking for logic level if possible....nothing fancy...nothing high frequency....just slow speed, jelly bean stuff. (in the same likeness as the 2N2222 or 2N3055. ;-)

Any insite would be appreciated.

Thanks,
-Quentin Lewis

PS: At work, I have designed in the BSS138 into a few circuits. It is sort of a standard for me....but it only seems to be sourced by two or perhaps three companies......doesn't sound like the 2N2222 to me.

## 2874. ethernet->analog radio

Hi. A friend of mine and I have been attempting for some time now to connect our computers over a radio ethernet (10BaseT) network. This has proved rather difficult considering that VERY few people have any idea about what this technology is.

We'd really like to know how to convert ethernet signals to analog ones. Specifically, ethernet -> analog radio signals. As much help as you can offer would be appreciated.
Thanx.

I've found all responsible ISPs (i.e., not the fake domains run by the spammers themselves..) have an "abuse" address, i.e. "abuse@xxxxxxxx.yyy". This is a good place to send complaints. Assuming one can take their autoresponders at face value, these complaints *are* read and *are* dealt with. Some ISPs will even respond to inform you the account of the person you complained about has been cancelled.

BTW I agree that simply using spam-filtering software in one's mailer isn't a real solution. The spam still has to download to your PC (costing you disk space, connect time and, if your ISP is long-distance, long distance charges) still has to be stored on your ISP's mail server (costing your ISP, and by extension you, disk space), and still has to be downloaded to your ISPs computers. (costing them, and by extension you, network bandwidth) Spammers are *STEALING* from you. I don't know if we can stop them, but we certainly shouldn't tolerate them.

# 2878. What is a"BOATANCHOR" ??

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-23 00:00:00 UTC
From: bry@REMOVE.mnsinc.com
Message-ID: <34271a9f.5124612@news.mnsinc.com>
Source record: 90741
Cross-posted to: rec.antiques.radio+phono,rec.audio.tubes,rec.radio.amateur.misc,rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew,uk.radio.amateur,rec.radio.swap,rec.radio.shortwave

What is a"BOATANCHOR" ??

Note the spelling. It is NOT Boat Anchor!!

Older radio equipment. Military transmitters and receivers
particularly seem to weigh a TON!
Older amateur radio equipment is qiote often described as a "B.A." or
a boatanchor. Heaby, no one wants it! It may need repair. So the
average appliance operator will not mess with it. That UNUSUAL guy
among unusual hobbyists is the "BA OP" who loves to shine the front
panel of a GLOBE KING or a an R-390A!! There are thousands of them out
there! They lurk at hamfests and in basements!

The BAs themselves are old, dusty, and they GLOW IN THE DARK!!
Because they use tubes and heavy iron. They get the job done in a
noble way! They sound "FB on AM, OM!!" They simply SING on CW!

The people who love and collect these old beasts have a number of
haunts on the web! Among them a FREE Reflector at TEMPE jsut called
Boatanchors, or informally known to some as "Free Boatanchors."

No they don't always have FREE RADIOS, but it is a FREE list as
opposed to being a PAY list like the other one!

So, IF you would like to try the FREE LIST, here is how to subscribe:

Simply send a message to:
LISTSERV@LISTSERV.TEMPE.GOV

with NO SUBJECT, and the text:

subscribe boatanchors <your full name>
as in " Joe H. Smith"

Alternatively, if you want to subscribe
anonymously, send the command: "SUBSCRIBE BOATANCHORS
Anonymous". Your subscription will then be hidden
automatically.
==========

Enjoy!! 73 de AF4K, Bry

: to 60 windings around a 1/4" slug.

I assume you mean an RF choke for suppressing noise on the 12 volt power line in a motor vehicle. If so, your slug tuned coils are too small. Try taking the ferrite core out of a big junk TV flyback transformer. You can epoxy the ferrite halves together and wrap a a dozen or so turns around it. Wire it in series with the positive supply line to your mobile rig. That should help suppress noise.

Yes there is. My experience with ByteMarks Core-Calc software has shown me they are capable of false advertising claims. It never even came close to working as advertised on their web site and they never shipped me a working copy or any other copy. I paid them on May 14 1997. In July their story was the programmer quit. When I looked at their web site a few weeks ago they were still advertising and selling it. BTW Amidon is not affiliated with ByteMark.

>

Yup. I had one such notice yesterday, telling me the spammer's
account was cancelled. It was particularly gratifying because
this particular spam had been sent with a false "received from"
line, and I only guessed at the true source. Of course, the ISP
may just have been lying to placate me. <shrug>

An idea occurred to me yesterday - the major computer magazines
could play a critical role in halting spam, if we approach them
correctly. I'll email BYTE and ask them to run an article surveying
the major ISP's as to how they deal with spammers and complaints.
I, for one, would never patronize an ISP who propagated spam.
The providers will fall all over themselves to appear holier than
their neighbor - they might even follow up with an improved course
of action. Granted, the smaller ISP's won't be mentioned, and might
feel themselves immune to anti-spam campaigns, but they get THEIR
service through one of the big players - mci, uunet, etc. The
pressure should trickle down to the little guys too, if BYTE and
the Internet users lean hard enough. If the survey article were
an annual feature, the pressure would be ongoing.

Help me support this idea - pass it on to other anti-spam discussions
and web sites, and email the editors of computer magazines.

# 2886. QB4/1100 (4-400A) curves ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-23 00:00:00 UTC
From: pascal S <pascal.sternis@art.NOSPAM.alcatel.fr>
Message-ID: <34284315.75A@art.NOSPAM.alcatel.fr>
Source record: 90749

Hi All,
I'm not myself a radio amateur, but maybe I could get here the information I'm looking for :
Lately, I bought from a ham , a pair of PHILIPS QB4/1100 tetrodes that I believe, is the european substitute for the 4-400A transmitting tube. (I suppose some of you are using this tube).
I would like to experiment in audio with these , but, before playing with kilovolts, I was wondering whether anybody could provide the (Ip/Vp) curves for this tube. I have already some of its characteristics and ratings, (which are really impressive!) but It 's not sufficient for me.
I have already posted this request to rec.audio.tubes, but I have got no answer so far (I think the use of this tube may be very seldom in audio).
These tubes look so nice and powerful, that not using it would be a shame for me!
Thanks in Advance,
Pascal

Hello,
Sometime ago, an individual posted a request to this group looking for
plans to build two meter radios.I saved his post with email address,
but now I can't find it. I recall he may have been at Kansas Univiristy
or Kansas State. I that person is reading this or some one else knows
this person. I woul like to corraspomd with thim. I appears we may
have similar interests.

I'm looking for any documentation on a very old (tube) HF set: SBE model 33 (15, 20, 40 and 80 meters). Probably made in USA. The 40 and 80 meter band starts at 7.15 and 3.8 MHz, but in Europe it is UP TO these frequencies. Want to modify this set to use it as a receiver. Anyone know anything of SBE??

I'm also looking for a European adress of the importer of ADI VHF/UHF transceiver. As you probably already noticed my call is pd1ADI so I want to ask those guys whether they can sponsor me while I'm like a living commercial for them (hi).

Any info is welcome!

Thnx

73! PD1ADI

# 2891. Looking for modifications on Kenwood TS 780 VHF/UHF all mode base rig

Newsgroup: rec.radio.amateur.homebrew

Cross-posted to: alt.ham-radio.marketplace,nl.radio.amateur,rec.radio.amateur,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,uk.radio.amateur

I'm am desperately looking for modifications on Kenwood TS 780 VHF/UHF all mode base rig!

I want to:

- Extend the RX range (want to be able to receive around 150 MHz)
- Improve RX sensibility (is quite OK but if possible better RX would be nice)
- Pump up the HF power if possible (is now 10 watt, I've heard that 3dB gain is possible)
- Setup the Signal meter properly (The needle's a bit heavy.. hi)
- Change the "low power" settings (should be 1 watt, is now 180 mW)
- Built in CTCSS (To open "modern" repeaters)

The Kenwood TS 780 is a 80's VHF/UHF set, please be so kind to review your "old" docs and help a just started Dutch HAM friend out!

Thanks in advance!

Pleun (PD1ADI locator JO21WT)
